General Description

Maxim's DG528/DG529 are monolithic, 8-channel, CMOS multiplexers with on-board address and control latches that simplify design and reduce board space in microprocessor-based applications. The DG528 is a single-ended, 1-of-8 multiplexer, while the DG529 is a differential, 2-of-8 multiplexer. These devices can operate as multiplexers or demultiplexers.

The DG528/DG529 have break-before-make switching to prevent momentary shorting of the input signals. Each device operates with dual supplies (\pm 4.5V to \pm 20V) or a single supply (+5V to +30V). All logic inputs are TTL and CMOS compatible. The Maxim DG528/DG529 are pin and electrically compatible with the industry-standard DG528/DG529.

Applications

Data-Acquisition Systems Automatic Test Equipment Avionics and Military Systems Communication Systems Microprocessor-Controlled Systems Audio-Signal Multiplexing

- _____Features
- Low-Power, Monolithic CMOS Design
- On-Board Address Latches
- Break-Before-Make Input Switches
- TTL and CMOS Logic Compatible
- Microprocessor-Bus Compatible
- + rDS(ON) < 400Ω
- Pin and Electrically Compatible with the Industry-Standard DG528/DG529 and ADG528/ADG529

_Ordering Information

ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to V-

Vollage Referenced to V-	
V+	+44V
GND	+25V
Digital Inputs VS, VD	V2V to V+ +2V
or 20mA,	whichever occurs first.
Current (any terminal, except S or D)	30mA
Continuous Current, S or D	
Peak Current, S or D	20mA
(pulsed at 1ms, 10% duty cycle max).	50mA
Continuous Power Dissipation (TA = +70	°C) (Note 1)
18-Pin Plastic DIP (derate 11.11mW/°C	above +70°C)889mW

18-Pin Wide SO (derate 9.52mW/°C above +70°C)762mW
18-Pin CERDIP (derate 10.53mW/°C above +70°C)842mW
20-Pin PLCC (derate 10.00mW/°C above +70°C)800mW
20-Pin LCC (derate 9.09mW/°C above +70°C)
Operating Temperature Ranges

DG52_C	0°C to +70°C
DG52_D_/E	40°C to +85°C
DG52_A	55°C to +125°C
Storage Temperature Range	65°C to +150°C
Lead Temperature (soldering, 10sec)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Note 1: All leads are soldered or welded to PC board.

(V+ = 15V, V- = -15V, V_{EN} = 2.4V, \overline{WR} = 0V, \overline{RS} = 2.4V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted.)

_Detailed Description

The internal structures of the DG528/DG529 include translators for the A2/A1/A0/EN/WR/RS digital inputs, latches, and a decode section for channel selection (Truth Tables). The gate structures consist of parallel combinations of N and P MOSFETs.

 $\label{eq:WR} \begin{array}{l} \hline \mbox{WRITE} & (\overline{WR}) \mbox{ and } \overline{RESET} \mbox{ (RS) strobes are provided for interfacing with μP-bus lines (Figure 9), alleviating the need for the μP to provide constant address inputs to the mux to hold a particular channel. \\ \hline \end{array}$

When the $\overline{\text{WR}}$ strobe is in the low state (less than 0.8V) and the $\overline{\text{RS}}$ strobe is in the high state (greater than 2.4V), the muxes are in the transparent mode—they act similarly to nonlatching devices, such as the DG508A/DG509A or the HI508/HI509.

When the \overline{WR} goes high, the previous BCD address input is latched and held in that state indefinitely. To pull the mux out of this state, either \overline{WR} must be taken

low to the transition state, or $\overline{\text{RS}}$ must be taken low to turn off all channels.

RS turns off all channels when it is low, which resets channel selection to the channel 1 mode.

The DG528/DG529 work with both single and dual supplies and function over the +5V to +30V single-supply range. For example, with a single +15V power supply, analog signals in the 0V to +15V range can be switched normally. If negative signals around 0V are expected, a negative supply is needed. However, only -5V is needed to normally switch signals in the -5V to +15V range (-5V, +15V supplies). No current is drawn from the negative supply, so Maxim's MAX635 DC-DC converter is an ideal choice.

The EN latch allows all switches to be turned off under program control. This is useful when two or more DG528s are cascaded to build 16-line and larger analog-signal multiplexers.

Applications

Operation with Supply Voltages Other Than ±15V

Maxim guarantees the DG528/DG529 for operation from $\pm 4.5V$ to $\pm 20V$ supplies. The switching delays increase by about a factor of two at $\pm 5V$, and breakbefore-make action is preserved.

The DG528/DG529 can operate with a single +5V to +30V supply as well as asymmetrical power supplies like +15V and -5V. The digital threshold will remain approximately 1.6V above the GND pin, and the analog characteristics such as $r_{DS(ON)}$ are determined by the total voltage difference between V+ and V-. Connect V-to 0V when operating with a +5V to +30V single supply.

Digital Interface Levels

The typical digital threshold of both the address lines and EN is 1.6V with a temperature coefficient of approximately -3mV/°C, ensuring compatibility with TTL logic over the temperature range. The digital threshold is relatively independent of the power-supply voltages, going from a typical 1.6V when V+ is 15V to 1.5V typical with V+ = 5V. Therefore, Maxim's DG528/DG529 operate with standard TTL logic levels, even with \pm 5V power supplies. In all cases, EN's threshold is the same as the other logic inputs and is referenced to GND.

The digital inputs can also be driven with CMOS logic levels swinging from either V+ to V- or from V+ to GND. The digital input current is just a few nanoamps of leakage at all input-voltage levels with a guaranteed maximum of 1µA. The digital inputs are protected from ESD by a 30V zener diode between the input and V+ and can be driven $\pm 2V$ beyond the supplies without drawing excessive current.
