

# LD2980ABxx

# LD2980Cxx

Ultra low drop voltage regulators compatible  
with low ESR inhibit output capacitors

## Features

- Stable with low ESR ceramic capacitors
- Ultra low dropout voltage (0.12 V typ. at 50 mA load, 7 mV typ. at 1 mA load)
- Very low quiescent current (80  $\mu$ A typ. at no load in on mode; max 1  $\mu$ A in off mode)
- Guaranteed output current up to 50 mA
- Logic-controlled electronic shutdown
- Output voltage of 1.8; 3.0; 3.3; 3.6; 5.0 V
- Internal current and thermal limit
- $\pm 0.5\%$  Tolerance output voltage available (A version)
- Output low noise voltage 160  $\mu$ VRMS
- Temperature range: -40 to 125 °C
- Smallest package SOT23-5L and SOT-89
- Fast dynamic response to line and load changes

available on pin n° 3 (TTL compatible). This means that when the device is used as local regulator, it is possible to put a part of the board in standby, decreasing the total power consumption. The LD2980 is designed to work with low ESR ceramic capacitors. Typical applications are cellular phone, laptop computer, personal digital assistant (PDA), personal stereo, camcorder and camera.

## Description

The low drop-voltage and the ultra low quiescent current make them suitable for low noise, low power applications and in battery poweredsystems. The quiescent current in sleep mode is less than 1  $\mu$ A when the INHIBIT pin is pulled low. A shutdown logic control function is

**Table 1. Device summary**

## 2 Pin configuration

**Figure 2.** Pin connections (top view)

**Table 2.** Pin description

Pin n° SOT23-5L	Pin n° SOT-89	Symbol	Name and Function
1	3	V <sub>IN</sub>	Input port
2	2	GND	Ground pin
3		INHIBIT	Control switch ON/OFF. Inhibit is not internally pulled-up; it cannot be left floating. Disable the device when connected to GND or to a positive voltage less than 0.18 V
4		NC	Not connected
5	1	V <sub>OUT</sub>	Output port

**Table 3.** Thermal data

Symbol	Parameter	SOT23-5L	SOT-89	Unit
R <sub>thJC</sub>	Thermal resistance junction-case	81	15	°C/W
R <sub>thJA</sub>	Thermal resistance junction-ambient	255	110	°C/W

### 3 Maximum ratings

**Table 4. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_I$	DC input voltage	-0.3 to 16	V
$V_{INH}$	INHIBIT input voltage	-0.3 to 16	V
$I_O$	Output current	Internally limited	
$P_D$	Power dissipation	Internally limited	
$T_{STG}$	Storage temperature range	-55 to 150	°C
$T_{OP}$	Operating junction temperature range	-40 to 125	°C

**Note:** *Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.*

## 4 Typical application

Figure 3. Application circuit

Note: Inhibit pin is not internally pulled-up then it must not be left floating. Disable the device when connected to GND or to a positive voltage less than 0.18 V.

## 5 Electrical characteristics

**Table 5. Electrical characteristics for LD2980AB** ( $T_J = 25^\circ\text{C}$ ,  $V_I = V_{O(\text{NOM})} + 1 \text{ V}$ ,  $C_I = 1 \mu\text{F(X7R)}$ ,  $C_O = 2.2 \mu\text{F (X7R)}$ ,  $I_O = 1 \text{ mA}$ ,  $V_{INH} = 2 \text{ V}$ , unless otherwise specified).

## 7 Application notes

### 7.1 External capacitors

Like any low-dropout regulator, the LD2980 requires external capacitors for regulator stability. This capacitor must be selected to meet the requirements of minimum capacitance and equivalent series resistance. We suggest to solder input and output capacitors as close as possible to the relative pins.

### 7.2 Input capacitor

An input capacitor whose value is 1  $\mu\text{F}$  is required with the LD2980 (amount of capacitance can be increased without limit). This capacitor must be located a distance of not more than 0.5" from the input pin of the device and returned to a clean analog ground. Any good quality ceramic, tantalum or film capacitors can be used for this capacitor.

### 7.3 Output capacitor

The LD2980 is designed specifically to work with ceramic output capacitors. It may also be possible to use Tantalum capacitors, but these are not as attractive for reasons of size and cost. By the way, the output capacitor must meet both the requirement for minimum amount of capacitance and ESR (equivalent series resistance) value. The [Figure 4](#) and [Figure 5](#) show the allowable ESR range as a function of the output capacitance. These curves represent the stability region over the full temperature and  $I_O$  range. Due to the different loop gain, the stability improves for higher output versions and so the suggested minimum output capacitor value, if low ESR ceramic type is used, is 1  $\mu\text{F}$  for output voltages equal or major than 3.8 V, 2.2  $\mu\text{F}$  for output voltages from 2.85 to 3.3 V, and 3.3  $\mu\text{F}$  for the other versions. However, if an output capacitor lower than the suggested one is used, it's possible to make stable the regulator adding a resistor in series to the capacitor (see [Figure 1](#) and [Figure 2](#) to choose the right value according to the used version and keeping in account that the ESR of ceramic capacitors has been measured @ 100 kHz).

### 7.4 Important

The output capacitor must maintain its ESR in the stable region over the full operating temperature to assure stability. Also, capacitor tolerance and variation with temperature must be considered to assure the minimum amount of capacitance is provided at all times. This capacitor should be located not more than 0.5" from the output pin of the device and returned to a clean analog ground.

### 7.5 Inhibit input operation

The inhibit pin can be used to turn OFF the regulator when pulled low, so drastically reducing the current consumption down to less than 1  $\mu\text{A}$ . When the inhibit feature is not used, this pin must be tied to  $V_I$  to keep the regulator output ON at all times. To assure proper operation, the signal source used to drive the inhibit pin must be able to swing above and below the specified thresholds listed in the electrical characteristics section under  $V_{IH}$   $V_{IL}$ . Any slew rate can be used to drive the inhibit.

## 7.6 Reverse current

The power transistor used in the LD2980 has not an inherent diode connected between the regulator input and output. If the output is forced above the input, no current will flow from the output to the input across the series pass transistor. When a  $V_{REV}$  voltage is applied on the output, the reverse current measured, according to the test circuit in [Figure 22](#), flows to the GND across the two feedback resistors. This current typical value is 160  $\mu$ A.  $R_1$  and  $R_2$  resistors are implanted type; typical values are, respectively, 42.6 k $\Omega$  and 51.150 k $\Omega$ .

## 8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
