TEXAS INSTRUMENTS

LDC1612, LDC1614

SNOSCY9 – DECEMBER 2014

LDC1612, LDC1614 Multi-Channel 28-Bit Inductance to Digital Converter (LDC) for Inductive Sensing

1 Features

- Easy-to-use – minimal configuration required
- Measure up to 4 sensors with one IC
- Multiple channels support environmental and aging compensation
- Multi-channel remote sensing provides lowest system cost
- Pin-compatible medium and high-resolution options
  - LDC1312/4: 2/4-ch 12-bit LDC
  - LDC1612/4: 2/4-ch 28-bit LDC
- Sensing range beyond two coil diameters
- Supports wide sensor frequency range of 1kHz to 10MHz
- Power consumption:
  - 35 µA Low Power Sleep Mode
  - 200 nA Shutdown Mode
- 3.3V operation
- Support internal or external reference clock
- Immune to DC magnetic fields and magnets

2 Applications

- Knobs in consumer, appliances, and automotive
- Linear and rotational encoders
- Buttons in home electronics, wearables, manufacturing, and automotive
- Keypads in manufacturing and appliances
- Slider buttons in consumer products
- Metal detection in industrial and automotive
- POS and EPOS
- Flow meters in consumer and appliances

3 Description

The LDC1612 and LDC1614 are 2- and 4-channel, 28-bit inductance to digital converters (LDCs) for inductive sensing solutions. With multiple channels and support for remote sensing, the LDC1612 and LDC1614 enable the performance and reliability benefits of inductive sensing to be realized at minimal cost and power. The products are easy to use, only requiring that the sensor frequency be within 1 kHz and 10 MHz to begin sensing. The wide 1 kHz to 10 MHz sensor frequency range also enables use of very small PCB coils, further reducing sensing solution cost and size.

The high resolution channels allow for a much larger sensing range, maintaining good performance beyond two coil diameters. Well-matched channels allow for differential and ratiometric measurements, which enable designers to use one channel to compensate their sensing for environmental and aging conditions such as temperature, humidity, and mechanical drift.

Given their ease of use, low power, and low system cost these products enable designers to greatly improve performance, reliability, and flexibility over existing sensing solutions and to introduce brand new sensing capabilities to products in all markets, especially consumer and industrial applications.
These devices are easily configured via an I2C interface. The two-channel LDC1612 is available in a WSON-12 package and the four-channel LDC1614 is available in a WQFN-16 package.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LDC1612	WSON-12	4 mm × 4 mm
LDC1614	WQFN-16	4 mm × 4 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

5 Pin Configuration and Functions

Top View
LDC1612 WSON-12   LDC1614 WQFN-16

Pin Functions

PIN		TYPE[1]	DESCRIPTION
NAME	NO.		
SCL	1	I	I2C Clock input
SDA	2	I/O	I2C Data input/output
CLKIN	3	I	Master Clock input. Tie this pin to GND if internal oscillator is selected
ADDR	4	I	I2C Address selection pin: when ADDR=L, I2C address = 0x2A, when ADDR=H, I2C address = 0x2B.
INTB	5	O	Configurable Interrupt output pin
SD	6	I	Shutdown input
VDD	7	P	Power Supply
GND	8	G	Ground
IN0A	9	A	External LC sensor 0 connection
IN0B	10	A	External LC sensor 0 connection
IN1A	11	A	External LC sensor 1 connection
IN1B	12	A	External LC sensor 1 connection
IN2A	13	A	External LC sensor 2 connection (LDC1614 only)
IN2B	14	A	External LC sensor 2 connection (LDC1614 only)
IN3A	15	A	External LC sensor 3 connection (LDC1614 only)
IN3B	16	A	External LC sensor 3 connection (LDC1614 only)
DAP[2]	DAP	N/A	Connect to Ground

(1) I = Input, O = Output, P=Power, G=Ground, A=Analog
(2) There is an internal electrical connection between the exposed Die Attach Pad (DAP) and the GND pin of the device. Although the DAP can be left floating, for best performance the DAP should be connected to the same potential as the device's GND pin. Do not use the DAP as the primary ground for the device. The device GND pin must always be connected to ground.

6 Specifications

6.1 Absolute Maximum Ratings

		MIN	MAX	UNIT
VDD	Supply Voltage Range		5	V
Vi	Voltage on any pin	-0.3	VDD+0.3	V
IA	Input current on any INx pin	-8	8	mA
ID	Input current on any Digital pin	-5	5	mA
Tj	Junction Temperature	-55	150	°C
T_{stg}	Storage temperature range	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
LDC1612 in WSON-12 package				
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[1]	±250	
LDC1614 in QFN-16 package				
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[1]	±250	

(1) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Unless otherwise specified, all limits ensured for T_A = 25°C, VDD = 3.3 V

		MIN	NOM	MAX	UNIT
VDD	Supply Voltage	2.7		3.6	V
T_A	Operating Temperature	-40		125	°C

6.4 Thermal Information

		LDC1612	LDC1614	UNIT
	THERMAL METRIC[1]	WSON	WQFN	
		12 PINS	16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	50	38	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics[1]

Unless otherwise specified, all limits ensured for T_A = 25°C, VDD = 3.3 V

PARAMETER		TEST CONDITIONS[2]	MIN[3]	TYP[4]	MAX[3]	UNIT
POWER						
V_{DD}	Supply Voltage	T_A = -40°C to +125°C	2.7		3.6	V
I_{DD}	Supply Current (not including sensor current)[5]	CLKIN = 10MHz [6]		2.1		mA
I_{DDSL}	Sleep Mode Supply Current[5]			35	60	µA
I_{SD}	Shutdown Mode Supply Current[5]			0.2	1	µA
SENSOR						
$I_{SENSORMAX}$	Sensor Maximum Current drive	HIGH_CURRENT_DRV = b0 DRIVE_CURRENT_CHx = 0xF800		1.5		mA
R_P	Sensor RP		1		100	kΩ
$IHD_{SENSORMAX}$	High current sensor drive mode: Sensor Maximum Current	HIGH_CURRENT_DRV = b1 DRIVE_CURRENT_CH0 = 0xF800 Channel 0 only		6		mA
$R_{P\_HD\_MIN}$	Minimum sensor RP			250		Ω
f_{SENSOR}	Sensor Resonance Frequency	T_A = -40°C to +125°C	0.001		10	MHz
$V_{SENSORMAX}$	Maximum oscillation amplitude (peak)			1.8		V
N_{BITS}	Number of bits				28	bits
f_{CS}	Maximum Channel Sample Rate	single active channel continuous conversion, SCL=400kHz			4.08	kSPS
C_{IN}	Sensor Pin input capacitance			4		pF
MASTER CLOCK						
f_{CLKIN}	External Master Clock Input Frequency (CLKIN)	T_A = -40°C to +125°C	2		40	MHz
$CLKIN_{DUTY\_MIN}$	External Master Clock minimum acceptable duty cycle (CLKIN)			40%		
$CLKIN_{DUTY\_MAX}$	External Master Clock maximum acceptable duty cycle (CLKIN)			60%		
V_{CLKIN_LO}	CLKIN low voltage threshold				0.3*VDD	V
V_{CLKIN_HI}	CLKIN high voltage threshold		0.7*VDD			V
f_{INTCLK}	Internal Master Clock Frequency range		35	43.4	55	MHz
$T_{Cf\_int\_\mu}$	Internal Master Clock Temperature Coefficient mean			-13		ppm/°C
TIMING CHARACTERISTICS						
t_{WAKEUP}	Wake-up Time from SD high-low transition to I2C readback				2	ms
$t_{WD-TIMEOUT}$	Sensor recovery time (after watchdog timeout)			5.2		ms

(1) Electrical Characteristics Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that TJ = TA. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where TJ > TA. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
(2) Register values are represented as either binary (b is the prefix to the digits), or hexadecimal (0x is the prefix to the digits). Decimal values have no prefix.
(3) Limits are ensured by testing, design, or statistical analysis at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.
(4) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.
(5) I2C read/write communication and pull-up resistors current through SCL, SDA not included.
(6) Sensor inductor: 2 layer, 32 turns/layer, 14mm diameter, PCB inductor with L=19.4µH, R_P=5.7kΩ at 2MHz Sensor capacitor: 330pF 1% COG/NP0 Target: Aluminum, 1.5mm thickness Channel = Channel 0 (continuous mode) CLKIN = 40MHz, CHx_FIN_DIVIDER = b0000, CHx_FREF_DIVIDER = b00 0000 0001 CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100 RP_OVERRIDE = b1, AUTO_AMP_DIS = b1, DRIVE_CURRENT_CH0 = 0x9800

6.6 Switching Characteristics - I2C

Unless otherwise specified, all limits ensured for T_A = 25°C, VDD = 3.3 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
VOLTAGE LEVELS						
V_{IH}	Input High Voltage		0.7×VDD			V
V_{IL}	Input Low Voltage				0.3×VDD	V
V_{OL}	Output Low Voltage (3mA sink current)				0.4	V
HYS	Hysteresis			0.1×VDD		V
I2C TIMING CHARACTERISTICS						
f_{SCL}	Clock Frequency		10		400	kHz
t_{LOW}	Clock Low Time		1.3			µs
t_{HIGH}	Clock High Time		0.6			µs
$t_{HD;STA}$	Hold Time (repeated) START condition	After this period, the first clock pulse is generated	0.6			µs
$t_{SU;STA}$	Set-up time for a repeated START condition		0.6			µs
$t_{HD;DAT}$	Data hold time		0			µs
$t_{SU;DAT}$	Data setup time		100			ns
$t_{SU;STO}$	Set-up time for STOP condition		0.6			µs
t_{BUF}	Bus free time between a STOP and START condition		1.3			µs
$t_{VD;DAT}$	Data valid time				0.9	µs
$t_{VD;ACK}$	Data valid acknowledge time				0.9	µs
t_{SP}	Pulse width of spikes that must be suppressed by the input filter[1]				50	ns

(1) This parameter is specified by design and/or characterization and is not tested in production.

7 Detailed Description

7.1 Overview

Conductive objects brought in contact with an AC electromagnetic (EM) field will induce field changes that can be detected using a sensor such as an inductor. Conveniently, an inductor, along with a capacitor, can be used to construct an L-C resonator, also known as an L-C tank, which can be used to produce an EM field. In the case of an L-C tank, the effect of the field disturbance is an apparent shift in the inductance of the sensor, which can be observed as a shift in the resonant frequency. Using this principle, the LDC1612/1614 is an inductance-to-digital converter (LDC) that measures the oscillation frequency of an LC resonator. The device outputs a digital value that is proportional to frequency. This frequency measurement can be converted to an equivalent inductance.

7.2 Functional Block Diagram
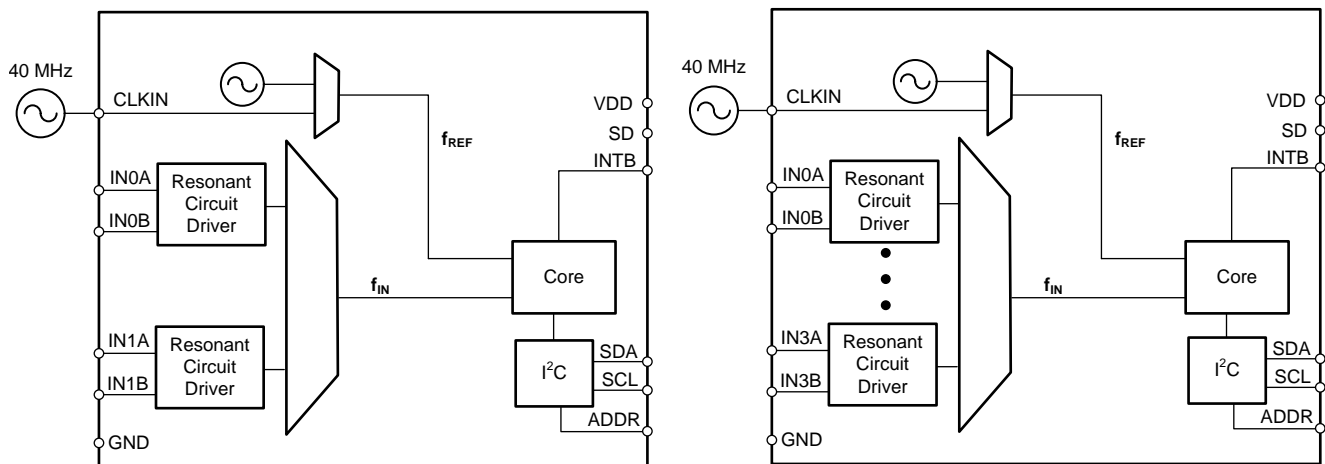

Figure 10. Block Diagrams for the LDC1612 (left) and LDC1614 (right)

The LDC1612/LDC1614 is composed of front-end resonant circuit drivers, followed by a multiplexer that sequences through the active channels, connecting them to the core that measures and digitizes the sensor frequency (f_{SENSOR}). The core uses a reference frequency (f_{REF}) to measure the sensor frequency. f_{REF} is derived from either an internal reference clock (oscillator), or an externally supplied clock. The digitized output for each channel is proportional to the ratio of f_{SENSOR}/f_{REF}. The I2C interface is used to support device configuration and to transmit the digitized frequency values to a host processor. The LDC can be placed in shutdown mode, saving current, using the SD pin. The INTB pin may be configured to notify the host of changes in system status.

7.3 Feature Description

7.3.1 Clocking Architecture

Figure 11 shows the clock dividers and multiplexers of the LDC.

Feature Description (continued)
Figure 11. Clocking Diagram

(1) LDC1614 only

In Figure 11, the key clocks are f_{IN}, f_{REF}, and f_{CLK}. f_{CLK} is selected from either the internal clock source or external clock source (CLKIN) . The frequency measurement reference clock, f_{REF}, is derived from the f_{CLK} source. It is recommended that precision applications use an external master clock that offers the stability and accuracy requirements needed for the application. The internal oscillator may be used in applications that require low cost and do not require high precision. The f_{INx} clock is derived from sensor frequency for a channel x, $f_{SENSORx}$. f_{REFx} and f_{INx} must meet the requirements listed in Table 1, depending on whether f_{CLK} (master clock) is the internal or external clock.

Table 1. Clock Configuration Requirements

MODE[1]	CLKIN SOURCE	VALID f_{REFx} RANGE (MHz)	VALID f_{INx} RANGE	SET CHx_FIN_DIVIDER to	SET CHx_SETTLECOUNT to	SET CHx_RCOUNT to
Multi-Channel	Internal	$f_{REFx} < 55$	$< f_{REFx}/4$	> b0001 [2]	> 3	> 8
	External	$f_{REFx} < 40$				
Single-Channel	Either external or internal	$f_{REFx} < 35$				

(1)   Channels 2 and 3 are only available for LDC1614
(2)   If $f_{SENSOR} \geq 8.75$ MHz, then CHx_FIN_DIVIDER must be ≥ 2

Table 2 shows the clock configuration registers for all channels.

Table 2. Clock Configuration Registers

CHANNEL[1]	CLOCK	REGISTER	FIELD [BIT(S)]	VALUE
All	f_{CLK} = Master Clock Source	CONFIG, addr 0x1A	REF_CLK_SRC [9]	b0 = internal oscillator is used as the master clock b1 = external clock source is used as the master clock
0	f_{REF0}	CLOCK_DIVIDERS_CH0, addr 0x14	CH0_FREF_DIVIDER [9:0]	$f_{REF0} = f_{CLK}$ / CH0_FREF_DIVIDER
1	f_{REF1}	CLOCK_DIVIDERS_CH1, addr 0x15	CH1_FREF_DIVIDER [9:0]	$f_{REF1} = f_{CLK}$ / CH1_FREF_DIVIDER
2	f_{REF2}	CLOCK_DIVIDERS_CH2, addr 0x16	CH2_FREF_DIVIDER [9:0]	$f_{REF2} = f_{CLK}$ / CH2_FREF_DIVIDER
3	f_{REF3}	CLOCK_DIVIDERS_CH3, addr 0x17	CH3_FREF_DIVIDER [9:0]	$f_{REF3} = f_{CLK}$ / CH3_FREF_DIVIDER
0	f_{IN0}	CLOCK_DIVIDERS_CH0, addr 0x14	CH0_FIN_DIVIDER [15:12]	$f_{IN0} = f_{SENSOR0}$ / CH0_FIN_DIVIDER
1	f_{IN1}	CLOCK_DIVIDERS_CH1, addr 0x15	CH1_FIN_DIVIDER [15:12]	$f_{IN1} = f_{SENSOR1}$ / CH1_FIN_DIVIDER
2	f_{IN2}	CLOCK_DIVIDERS_CH2, addr 0x16	CH2_FIN_DIVIDER [15:12]	$f_{IN2} = f_{SENSOR2}$ / CH2_FIN_DIVIDER
3	f_{IN3}	CLOCK_DIVIDERS_CH3, addr 0x17	CH3_FIN_DIVIDER [15:12]	$f_{IN3} = f_{SENSOR3}$ / CH3_FIN_DIVIDER

(1)   Channels 2 and 3 are only available for LDC1614

7.3.2   Multi-Channel and Single Channel Operation

The multi-channel package of the LDC enables the user to save board space and support flexible system design. For example, temperature drift can often cause a shift in component values, resulting in a shift in resonant frequency of the sensor. Using a 2nd sensor as a reference provides the capability to cancel out a temperature shift. When operated in multi-channel mode, the LDC sequentially samples the active channels. In single channel mode, the LDC samples a single channel, which is selectable. The following table shows the registers and values that are used to configure either multi-channel or single channel modes.

Table 3. Single and Multi-Channel Configuration Registers

MODE	REGISTER	FIELD [BIT(S)]	VALUE[1]
Single channel	CONFIG, addr 0x1A	ACTIVE_CHAN [15:14]	00 = chan 0 01 = chan 1 10 = chan 2 11 = chan 3
	MUX_CONFIG addr 0x1B	AUTOSCAN_EN [15]	0 = continuous conversion on a single channel (default)
Multi-channel	MUX_CONFIG addr 0x1B	AUTOSCAN_EN [15]	1 = continuous conversion on multiple channels
	MUX_CONFIG addr 0x1B	RR_SEQUENCE [14:13]	00 = Ch0, Ch 1 01 = Ch0, Ch 1, Ch 2 10 = Ch0, CH1, Ch2, Ch3

(1)   Channels 2 and 3 are only available for LDC1614

The digitized sensor measurement for each channel (DATAx) represents the ratio of the sensor frequency to the reference frequency:

$$\text{DATAx} / 2^{28} = f_{SENSORx} / f_{REFx} \tag{1}$$

The sensor frequency can be calculated from:

$$f_{\text{sensor}} = \frac{\text{DATAx} * f_{REFx}}{2^{28}} \tag{2}$$

Product Folder Links: LDC1612 LDC1614

The following table illustrates the registers that contain the fixed point sample values for each channel.

Table 4. LDC1614/1314 Sample Data Registers

Channel[1]	Register[2]	Field name [bits(s)]	Value[3][4]
0	DATA_MSB_CH0, addr 0x00	DATA0 [11:0]	12 MSBs of the 28 bit result
	DATA_LSB_CH0, addr 0x01	DATA0 [15:0]	16 LSBs of the 28 bit conversion result
1	DATA_MSB_CH1, addr 0x02	DATA1 [11:0]	12 MSBs of the 28 bit result
	DATA_LSB_CH1, addr 0x03	DATA1 [15:0]	16 LSBs of the 28 bit conversion result
2	DATA_MSB_CH2, addr 0x04	DATA2 [11:0]	12 MSBs of the 28 bit result
	DATA_LSB_CH2, addr 0x05	DATA2 [15:0]	16 LSBs of the 28 bit conversion result
3	DATA_MSB_CH3, addr 0x06	DATA3 [11:0]	12 MSBs of the 28 bit result
	DATA_LSB_CH3, addr 0x07	DATA3 [15:0]	16 LSBs of the 28 bit conversion result

(1) Channels 2 and 3 available only in LDC1614.
(2) The DATA_MSB_ CHx.DATAx register must always be read first, followed by the DATA_LSB_ CHx.DATAx register of the same channel to ensure data coherency.
(3) A DATA value of 0x0000000 = under range for LDC1612/LDC1614
(4) A DATA value of 0xFFFFFFF = over range for LDC1612/LDC1614

When the LDC sequences through the channels in multi-channel mode, the dwell time interval for each channel is the sum of 3 parts: sensor activation time + conversion time + channel switch delay.

The sensor activation time is the amount of settling time required for the sensor oscillation to stabilize, as shown in Figure 12. The settling wait time is programmable and should be set to a value that is long enough to allow stable oscillation. The settling wait time for channel x is given by:

$$t_{Sx} = (CHX\_SETTLECOUNT \times 16)/f_{REFx}$$ (3)

Table 5 illustrates the registers and values for configuring the settling time for each channel.

Figure 12. Multi-channel Mode Sequencing

Figure 13. Single-channel Mode Sequencing

Product Folder Links: *LDC1612 LDC1614*

Table 5. Settling Time Register Configuration

Channel[1]	Register	Field	Conversion time[2]
0	SETTLECOUNT_CH0, addr 0x10	CH0_SETTLECOUNT (15:0)	(CH0_SETTLECOUNT*16)/f_{REF0}
1	SETTLECOUNT_CH1, addr 0x11	CH1_SETTLECOUNT (15:0)	(CH1_SETTLECOUNT*16)/f_{REF1}
2	SETTLECOUNT_CH2, addr 0x12	CH2_SETTLECOUNT (15:0)	(CH2_SETTLECOUNT*16)/f_{REF2}
3	SETTLECOUNT_CH3, addr 0x13	CH3_SETTLECOUNT (15:0)	(CH3_SETTLECOUNT*16)/f_{REF3}

(1) Channels 2 and 3 are available only in the LDC1614.
(2) f_{REFx} is the reference frequency configured for the channel.

The SETTLECOUNT for any channel x must satisfy:

$$CHx\_SETTLECOUNT \geq Q_{SENSORx} \times f_{REFx} / (16 \times f_{SENSORx})$$

where

- $f_{SENSORx}$ = Frequency of the Sensor on Channel x
- f_{REFx} = Reference frequency for Channel x
- $Q_{SENSORx}$ = Quality factor of the sensor on Channel x. Q is estimated by: (4)

$$Q = R_P \sqrt{\frac{C}{L}}$$
(5)

Round the result to the next highest integer (for example, if Equation 4 recommends a minimum value of 6.08, program the register to 7 or higher).

L, R_P and C values can be obtained by using Texas Instrument's WEBENCH® for the coil design.

The conversion time represents the number of reference clock cycles used to measure the sensor frequency. It is set by the CHx_RCOUNT register for the channel. The conversion time for any channel x is:

$$t_{Cx} = (CHx\_RCOUNT \times 16 + 4) / f_{REFx}$$
(6)

The reference count value must be chosen to support the required number of effective bits (ENOB). For example, if an ENOB of 13 bits is required, then a minimum conversion time of 2^{13} = 8192 clock cycles is required. 8192 clock cycles correspond to a CHx_RCOUNT value of 0x0200.

Table 6. Conversion Time Configuration Registers, Channels 0 - 3[1]

CHANNEL	REGISTER	FIELD [BIT(S)]	CONVERSION TIME
0	RCOUNT_CH0, addr 0x08	CH0_RCOUNT (15:0)	(CH0_RCOUNT*16)/f_{REF0}
1	RCOUNT_CH1, addr 0x09	CH1_RCOUNT (15:0)	(CH1_RCOUNT*16)/f_{REF1}
2	RCOUNT_CH2, addr 0x0A	CH2_RCOUNT (15:0)	(CH2_RCOUNT*16)/f_{REF2}
3	RCOUNT_CH3, addr 0x0B	CH3_RCOUNT (15:0)	(CH3_RCOUNT*16)/f_{REF3}

(1) Channels 2 and 3 are available only for LDC1614.

The typical channel switch delay time between the end of conversion and the beginning of sensor activation of the subsequent channel is:

$$Channel\ Switch\ Delay = 692\ ns + 5 / f_{ref}$$
(7)

The deterministic conversion time of the LDC allows data polling at a fixed interval. A data ready flag (DRDY) is also available for interrupt driven system designs (see the STATUS register description in *Register Maps*).

An offset value may be subtracted from each DATA value to compensate for a frequency offset or maximize the dynamic range of the sample data. The offset values should be < $f_{SENSORx\_MIN}$ / f_{REFx}. Otherwise, the offset might be so large that it masks the LSBs which are changing.

Table 7. Frequency Offset Registers

CHANNEL	REGISTER	FIELD [BIT(S)]	VALUE
0	OFFSET_CH0, addr 0x0C	CH0_OFFSET [15:0]	$f_{OFFSET0}$ = CH0_OFFSET * ($f_{REF0}/2^{16}$)
1	OFFSET_CH1, addr 0x0D	CH1_OFFSET [15:0]	$f_{OFFSET1}$ = CH1_OFFSET * ($f_{REF1}/2^{16}$)
2	OFFSET_CH2, addr 0x0E	CH2_OFFSET [15:0]	$f_{OFFSET2}$ = CH2_OFFSET * ($f_{REF2}/2^{16}$)
3	OFFSET_CH3, addr 0x0F	CH3_OFFSET [15:0]	$f_{OFFSET3}$ = CH3_OFFSET * ($f_{REF3}/2^{16}$)

The sensor frequency can be determined by:

$$f_{SENSORx} = \text{CHx\_FIN\_DIVIDER} * f_{REFx}\left(\frac{\text{DATAx}}{2^{28}} + \frac{\text{CHx\_OFFSET}}{2^{16}}\right)$$

where

- DATAx = Conversion result from the DATA_CHx register
- CHx_OFFSET = Offset value set in the OFFSET_CHx register   (8)

7.3.3 Current Drive Control Registers

The registers listed in Table 8 are used to control the sensor drive current. The recommendations listed in the last column of the table should be followed.

Auto-calibration mode is used to determine the optimal sensor drive current for a fixed sensor design. This mode should only be used during system prototyping.

The auto-amplitude correction attempts to maintain the sensor oscillation amplitude between 1.2V and 1.8V by adjusting the sensor drive current between conversions. When auto-amplitude correction is enabled, the output data may show non-monotonic behavior due to an adjustment in drive current. Auto-amplitude correction is only recommended for low-precision applications.

A high sensor current drive mode can be enabled to drive sensor coils with > 1.5mA on channel 0, only in single channel mode. This feature can be used when the sensor R_P is lower than 1kΩ. Set the HIGH_CURRENT_DRV register bit to b1 to enable this mode.

Table 8. Current Drive Control Registers

CHANNEL [1]	REGISTER	FIELD [BIT(S)]	VALUE
All	CONFIG, addr 0x1A	SENSOR_ACTIVATE_SEL [11]	Sets current drive for sensor activation. Recommended value is b0 (Full Current mode).
		RP_OVERRIDE_EN [12]	Set to b1 for normal operation (RP over ride enabled)
		AUTO_AMP_DIS [10]	Disables Automatic amplitude correction. Set to b1 for normal operation (disabled)
0	CONFIG, addr 0x1A	HIGH_CURRENT_DRV [6]	b0 = normal current drive (1.5 mA) b1 = Increased current drive (> 1.5 mA) for Ch 0 in single channel mode only. Cannot be used in multi-channel mode.
0	DRIVE_CURRENT_CH0, addr 0x1E	CH0_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 0 (auto-amplitude correction must be disabled and RP over ride=1)
		CH0_INIT_IDRIVE [10:6]	Initial drive current stored during auto-calibration. Not used for normal operation.
1	DRIVE_CURRENT_CH1, addr 0x1F	CH1_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 1 (auto-amplitude correction must be disabled and RP over ride=1)
		CH1_INIT_IDRIVE [10:6]	Initial drive current stored during auto-calibration. Not used for normal operation.

(1)   Channels 2 and 3 are available for LDC1614 only.

Product Folder Links: *LDC1612 LDC1614*

Table 8. Current Drive Control Registers (continued)

CHANNEL[1]	REGISTER	FIELD [BIT(S)]	VALUE
2	DRIVE_CURRENT_CH2, addr 0x20	CH2_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 2 (auto-amplitude correction must be disabled and RP over ride=1)
		CH2_INIT_IDRIVE [10:6]	Initial drive current stored during auto-calibration. Not used for normal operation.
3	DRIVE_CURRENT_CH3, addr 0x21	CH3_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 3 (auto-amplitude correction must be disabled and RP over ride=1)
		CH3_INIT_IDRIVE [10:6]	Initial drive current stored during auto-calibration. Not used for normal operation.

If the R_P value of the sensor attached to channel x is known, Figure 14 can be used to select the 5-bit value to be programmed into the IDRIVE field for the channel. Find the known R_P value on the vertical axis, and then read the corresponding decimal value on the horizontal axis. Program the hexadecimal equivalent of the x-axis value into the IDRIVE field. Note that IDRIVE = b00000 corresponds to 16 µA, and IDRIVE = b11111 corresponds to 1563 µA.
Figure 14. I$_{DRIVE}$ vs Rp

7.3.4 Device Status Registers

The registers listed in Table 9 may be used to read device status.

Table 9. Status Registers

CHANNEL[1]	REGISTER	FIELDS [BIT(S)]	VALUES
All	STATUS, addr 0x18	12 fields are available that contain various status bits [15:0]	Refer to Register Maps section for a description of the individual status bits.
All	ERROR_CONFIG, addr 0x19	12 fields are available that are used to configure error reporting [15:0]	Refer to Register Maps section for a description of the individual error configuration bits.

(1)   Channels 2 and 3 are available for LDC1614 only.

See the STATUS and ERROR_CONFIG register description in the Register Map section. These registers can be configured to trigger an interrupt on the INTB pin for certain events. The following conditions must be met:
1. The error or status register must be unmasked by enabling the appropriate register bit in the ERROR_CONFIG register
2. The INTB function must be enabled by setting CONFIG.INTB_DIS to 0

When a bit field in the STATUS register is set, the entire STATUS register content is held until read or until the DATA_MSB_CHx register is read. Reading also de-asserts INTB.

Interrupts are cleared by one of the following events:
1. Entering Sleep Mode
2. Power-on reset (POR)
3. Device enters Shutdown Mode (SD is asserted)
4. S/W reset
5. I2C read of the STATUS register: Reading the STATUS register will clear any error status bit set in STATUS along with the ERR_CHAN field and de-assert INTB

Setting register CONFIG.INTB_DIS to b1 disables the INTB function and holds the INTB pin high.

7.3.5 Input Deglitch Filter

The input deglitch filter suppresses EMI and ringing above the sensor frequency. It does not impact the conversion result as long as its bandwidth is configured to be above the maximum sensor frequency. The input deglitch filter can be configured in MUX_CONFIG.DEGLITCH register field as shown in Table 10. For optimal performance, it is recommended to select the lowest setting that exceeds the sensor oscillation frequency. For example, if the maximum sensor frequency is 2.0 MHz, choose MUX_CONFIG.DEGLITCH = b100 (3.3 MHz).

Table 10. Input deglitch filter register

CHANNEL[1]	MUX_CONFIG.DEGLITCH REGISTER VALUE	DEGLITCH FREQEUNCY
ALL	001	1 MHz
ALL	100	3.3 MHz
ALL	101	10 MHz
ALL	011	33 MHz

(1)   Channels 2 and 3 are available for LDC1614 only.

7.4 Device Functional Modes

7.4.1 Startup Mode

When the LDC powers up, it enters into Sleep Mode and will wait for configuration. Once the device is configured, exit Sleep Mode by setting CONFIG.SLEEP_MODE_EN to b0.

It is recommended to configure the LDC while in Sleep Mode. If a setting on the LDC needs to be changed, return the device to Sleep Mode, change the appropriate register, and then exit Sleep Mode.

7.4.2 Normal (Conversion) Mode

When operating in the normal (conversion) mode, the LDC is periodically sampling the frequency of the sensor(s) and generating sample outputs for the active channel(s).

7.4.3 Sleep Mode

Sleep Mode is entered by setting the CONFIG.SLEEP_MODE_EN register field to 1. While in this mode, the register contents are maintained. To exit Sleep Mode, set the CONFIG.SLEEP_MODE_EN register field to 0. After setting CONFIG.SLEEP_MODE_EN to b0, sensor activation for the first conversion will begin after 16,384 f_{INT} clock cycles. While in Sleep Mode the I2C interface is functional so that register reads and writes can be performed. While in Sleep Mode, no conversions are performed. In addition, entering Sleep Mode will clear any error condition and de-assert the INTB pin.

7.4.4 Shutdown Mode

When the SD pin is set to high, the LDC will enter Shutdown Mode. Shutdown Mode is the lowest power state. To exit Shutdown Mode, set the SD pin to low. Entering Shutdown Mode will return all registers to their default state.

While in Shutdown Mode, no conversions are performed. In addition, entering Shutdown Mode will clear any error condition and de-assert the INTB pin. While the device is in Shutdown Mode, is not possible to read to or write from the device via the I2C interface.

Device Functional Modes (continued)

7.4.4.1 Reset

The LDC can be reset by writing to RESET_DEV.RESET_DEV. Conversion will stop and all register values will return to their default value. This register bit will always return 0b when read.

7.5 Programming

The LDC device uses an I2C interface to access control and data registers.

7.5.1 I2C Interface Specifications

The LDC uses an extended start sequence with I2C for register access. The maximum speed of the I2C interface is 400kbit/s. This sequence follows the standard I2C 7bit slave address followed by an 8bit pointer register byte to set the register address. When the ADDR pin is set low, the LDC I2C address is 0x2A; when the ADDR pin is set high, the LDC I2C address is 0x2B. The ADDR pin must not change state after the LDC exits Shutdown Mode.
Figure 15. I2C Write Register Sequence

**Figure 16. I2C Read Register Sequence**

7.6 Register Maps

7.6.1 Register List

Fields indicated with Reserved must be written only with indicated values. Improper device operation may occur otherwise. The R/W column indicates the Read-Write status of the corresponding field. A 'R/W' entry indicates read and write capability, a 'R' indicates read-only, and a 'W' indicates write-only.

Figure 17. Register List

ADDRESS	NAME	DEFAULT VALUE	DESCRIPTION
0x00	DATA_MSB_CH0	0x0000	Channel 0 MSB Conversion Result and Error Status
0x01	DATA_LSB_CH0	0x0000	Channel 0 LSB Conversion Result. Must be read after Register address 0x00.
0x02	DATA_MSB_CH1	0x0000	Channel 1 MSB Conversion Result and Error Status.
0x03	DATA_LSB_CH1	0x0000	Channel 1 LSB Conversion Result. Must be read after Register address 0x02.
0x04	DATA_MSB_CH2	0x0000	Channel 2 MSB Conversion Result and Error Status. **(LDC1614 only)**
0x05	DATA_LSB_CH2	0x0000	Channel 2 LSB Conversion Result. Must be read after Register address 0x04.**(LDC1614 only)**
0x06	DATA_MSB_CH3	0x0000	Channel 3 MSB Conversion Result and Error Status. **(LDC1614 only)**
0x07	DATA_LSB_CH3	0x0000	Channel 3 LSB Conversion Result. Must be read after Register address 0x06. **(LDC1614 only)**
0x08	RCOUNT_CH0	0x0080	Reference Count setting for Channel 0
0x09	RCOUNT_CH1	0x0080	Reference Count setting for Channel 1
0x0A	RCOUNT_CH2	0x0080	Reference Count setting for Channel 2. **(LDC1614 only)**
0x0B	RCOUNT_CH3	0x0080	Reference Count setting for Channel 3.**(LDC1614 only)**
0x0C	OFFSET_CH0	0x0000	Offset value for Channel 0
0x0D	OFFSET_CH1	0x0000	Offset value for Channel 1

Table 35. Address 0x18, STATUS Field Descriptions

Bit	Field	Type	Reset	Description
15:14	ERR_CHAN	R	00	Error Channel Indicates which channel has generated a Flag or Error. Once flagged, any reported error is latched and maintained until either the STATUS register or the DATA_MSB_CHx register corresponding to the Error Channel is read. b00: Channel 0 is source of flag or error. b01: Channel 1 is source of flag or error. b10: Channel 2 is source of flag or error (LDC1614 only). b11: Channel 3 is source of flag or error (LDC1614 only).

Table 35. Address 0x18, STATUS Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	ERR_UR	R	0	Conversion Under-range Error b0: No Conversion Under-range error was recorded since the last read of the STATUS register. b1: An active channel has generated a Conversion Under-range error. Refer to STATUS.ERR_CHAN field to determine which channel is the source of this error.
12	ERR_OR	R	0	Conversion Over-range Error. b0: No Conversion Over-range error was recorded since the last read of the STATUS register. b1: An active channel has generated a Conversion Over-range error. Refer to STATUS.ERR_CHAN field to determine which channel is the source of this error.
11	ERR_WD	R	0	Watchdog Timeout Error b0: No Watchdog Timeout error was recorded since the last read of the STATUS register. b1: An active channel has generated a Watchdog Timeout error. Refer to STATUS.ERR_CHAN field to determine which channel is the source of this error.
10	ERR_AHE	R	0	Amplitude High Error b0: No Amplitude High error was recorded since the last read of the STATUS register. b1: An active channel has generated an Amplitude High error. Refer to STATUS.ERR_CHAN field to determine which channel is the source of this error.
9	ERR_ALE	R	0	Amplitude Low Error b0: No Amplitude Low error was recorded since the last read of the STATUS register. b1: An active channel has generated an Amplitude Low error. Refer to STATUS.ERR_CHAN field to determine which channel is the source of this error.
8	ERR_ZC	R	0	Zero Count Error b0: No Zero Count error was recorded since the last read of the STATUS register. b1: An active channel has generated a Zero Count error. Refer to STATUS.ERR_CHAN field to determine which channel is the source of this error.
6	DRDY	R	0	Data Ready Flag. b0: No new conversion result was recorded in the STATUS register. b1: A new conversion result is ready. When in Single Channel Conversion, this indicates a single conversion is available. When in sequential mode, this indicates that a new conversion result for all active channels is now available.
3	CH0_UNREADCONV	R	0	Channel 0 Unread Conversion b0: No unread conversion is present for Channel 0. b1: An unread conversion is present for Channel 0. Read Register DATA_CH0 to retrieve conversion results.
2	CH1_ UNREADCONV	R	0	Channel 1 Unread Conversion b0: No unread conversion is present for Channel 1. b1: An unread conversion is present for Channel 1. Read Register DATA_CH1 to retrieve conversion results.
1	CH2_ UNREADCONV	R	0	Channel 2 Unread Conversion b0: No unread conversion is present for Channel 2. b1: An unread conversion is present for Channel 2. Read Register DATA_CH2 to retrieve conversion results (LDC1614 only)
0	CH3_ UNREADCONV	R	0	Channel 3 Unread Conversion b0: No unread conversion is present for Channel 3. b1: An unread conversion is present for Channel 3. Read Register DATA_CH3 to retrieve conversion results (LDC1614 only)

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Theory of Operation

8.1.1.1 *Conductive Objects in an EM Field*

An AC current flowing through an inductor will generate an AC magnetic field. If a conductive material, such as a metal object, is brought into the vicinity of the inductor, the magnetic field will induce a circulating current (eddy current) on the surface of the conductor.
Figure 53. Conductor in AC Magnetic Field

The eddy current is a function of the distance, size, and composition of the conductor. The eddy current generates its own magnetic field, which opposes the original field generated by the sensor inductor. This effect is equivalent to a set of coupled inductors, where the sensor inductor is the primary winding and the eddy current in the target object represents the secondary inductor. The coupling between the inductors is a function of the sensor inductor, and the resistivity, distance, size, and shape of the conductive target. The resistance and inductance of the secondary winding caused by the eddy current can be modeled as a distance dependent resistive and inductive component on the primary side (coil). Figure 53 shows a simplified circuit model of the sensor and the target as coupled coils.

8.1.1.2 *L-C Resonators*

An EM field can be generated using an L-C resonator, or L-C tank. One topology for an L-C tank is a parallel R-L-C construction, as shown in Figure 54.

Application Information (continued)

*Parallel Electrical
Model, L-C Tank*
Figure 54. Electrical Model of the L-C Tank Sensor

In brief, an oscillator is constructed by combining a frequency selective circuit with a gain block in a closed loop. The criteria for oscillation are: (1) loop gain > 1, and (2) closed loop phase shift of 2π radians. In the context of an oscillator, the R-L-C resonator provides the frequency selectivity and contributes to the phase shift. At resonance, the impedance of the reactive components (L and C) cancels, leaving only R_P, the lossy (resistive) element in the circuit, and the voltage amplitude is maximized. The R_P can be used to determine the sensor drive current. A lower RP requires a larger sensor current to maintain a constant oscillation amplitude. The sensor oscillation frequency f_{SENSOR} is given by:

$$f_{SENSOR} = \frac{1}{2\pi\sqrt{LC}} * \sqrt{1 - \frac{1}{Q^2} - \frac{5*10^{-9}}{Q\sqrt{LC}}} \approx \frac{1}{2\pi\sqrt{LC}}$$

where

- C is the sensor capacitance ($C_{TANK} + C_{PAR}$)
- L is the inductance   (9)

The value of R_P can be approximated using:

$$Q = R_P\sqrt{\frac{C}{L}}$$

where

- R_S is the AC series resistance of the inductor   (10)

Application Information (continued)

Texas Instruments' WEBENCH design tool can be used for coil design, in which the parameter values for R_P, L and C are calculated. See http://www.ti.com/webench.

R_P is a function of target distance, target material, and sensor characteristics. Figure 55 shows that R_P is directly proportional to the distance between the sensor and the target. The graph represents a 14-mm diameter PCB coil (23 turns, 4-mil trace width, 4-mil spacing between traces, 1-oz copper thickness, FR4).
Figure 55. Example RP vs. Distance with a 14-mm PCB Coil and 2mm Thick Stainless Steel Target

It is important to configure the LDC current drive so that the sensor will still oscillate at the minimum RP value. As an example, if the closest target distance in a system with the response shown in Figure 55 is 1mm, then the LDC R_P value is 5 kΩ. The objective is to maintain a sufficient sensor oscillation voltage so that the sensor frequency can be measured even at the minimum operating distance. See section Current Drive Control Registers for details on setting the current drive.

The inductance that is measured by the LDC is

$$L(d) = L_{inf} - M(d) = \frac{1}{(2\pi * f_{SENSOR})^2 * C}$$

where

- L(d) is the measured sensor inductance, for a distance d between the sensor coil and target
- L_{inf} is the inductance of the sensing coil without a conductive target (target at infinite distance)
- M(d) is the mutual inductance
- f_{SENSOR} = sensor oscillation frequency for a distance d between the sensor coil and target
- C = C_{TANK} + C_{PAR} (11)

Figure 56 shows an example of variation in sensor frequency and inductance as a function of distance for a 14-mm diameter PCB coil (23 turns, 4-mil trace width, 4-mil spacing between traces, 1-oz copper thickness, FR4).

Product Folder Links: *LDC1612 LDC1614*

Application Information (continued)
**Figure 56. Example Sensor Frequency, Inductance vs. Target Distance
with 14-mm PCB Coil and 1.5 mm Thick Aluminum Target**

In the absence of magnetic materials, such as ferrous metals and ferrites, the inductance shift, and therefore the measured frequency shift, depends only on current flow geometries. Temperature drift is dominated by physical expansion of the inductor and other mechanical system components over temperature which alter current flow geometries. Note that the additional temperature drift of the sensor capacitor must also be taken into account.

For additional information on temperature effects and temperature compensation, see *LDC1000 Temperature Compensation* (SNAA212)

8.2 Typical Application

Example of a multi-channel implementation using the LDC1612. This example is representative of an axial displacement application, in which the target movement is perpendicular to the plane of the coil. The second channel can be used to sense proximity of a second target, or it can be used for temperature compensation by connecting a reference coil.
Figure 57. Example Multi-Channel Application - LDC1612

Typical Application (continued)

8.2.1 Design Requirements

- Design example in which Sensor 0 is used for proximity measurement and Sensor 1 is used for temperature compensation:
- using WEBENCH for coil design
- Target distance = 0.1 cm
- Distance resolution = 0.2 µm
- Target diameter = 1 cm
- Target material = stainless steel (SS416)
- Number of PCB layers for the coil = 2
- The application requires 1kSPS (T_{SAMPLE} = 1000 µs)

8.2.2 Detailed Design Procedure

The target distance, resolution and diameter are used as inputs to WEBENCH to design the sensor coil, The resulting coil design is a 2 layer coil, with an area of 2.5 cm^2, diameter of 1.77 cm, and 39 turns. The values for R_P, L and C are: R_P = 6.6 kΩ, L = 43.9 µH, C = 100 pF.

Using L and C, f_{SENSOR} = $1/2\pi\sqrt{(LC)}$ = $1/2\pi\sqrt{(43.9*10^{-6} * 100*10^{-12})}$ = 2.4 MHz

Using a system master clock of 40 MHz applied to the CLKIN pin allows flexibility for setting the internal clock frequencies. The sensor coil is connected to channel 0 (IN0A and IN0B pins).

After powering on the LDC, it will be in Sleep Mode. Program the registers as follows (example sets registers for channel 0 only; channel 1 registers can use equivalent configuration):

1. Set the dividers for channel 0.
   (a) Because the sensor freqeuncy is less than 8.75 MHz, the sensor divider can be set to 1, which means setting field CH0_FIN_DIVIDER to 0x1. By default, f_{IN0} = f_{SENSOR} = 2.4MHz.
   (b) The design constraint for f_{REF0} is > 4 × f_{SENSOR}. A 20 MHz reference frequency satisfies this constraint, so the reference divider should be set to 2. This is done by setting the CH0_FREF_DIVIDER field to 0x02.
   (c) The combined value for Chan. 0 divider register (0x14) is 0x1002.
2. Program the settling time for Channel 0. The calculated Q of the coil is 10(see Multi-Channel and Single Channel Operation).
   (a) CH0_SETTLECOUNT ≥ Q × f_{REF0} / (16 × $f_{SENSOR0}$) → 5.2, rounded up to 6. To provide margin to account for system tolerances, a higher value of 10 is chosen.
   (b) Register 0x10 should be programmed to a minimum of 10.
   (c) The settle time is: (10 x 16)/20,000,000 = 8 µs
   (d) The value for Chan. 0 SETTLECOUNT register (0x10) is 0x000A.
3. The channel switching delay is ~1µs for f_{REF} = 20 MHz (see Multi-Channel and Single Channel Operation)
4. Set the conversion time by the programming the reference count for Channel 0. The budget for the conversion time is : T_{SAMPLE} − settling time − channel switching delay = 1000 − 8 − 1 = 991 µs
   (a) To determine the conversion time register value, use the following equation and solve for CH0_RCOUNT: Conversion Time (t_{C0})= (CH0_RCOUNT×16)/f_{REF0}.
   (b) This results in CH0_RCOUNT having a value of 1238 decimal (rounded down)
   (c) Set the CH0_RCOUNT register (0x08) to 0x04D6.
5. Use the default values for the ERROR_CONFIG register (address 0x19). By default, no interrupts are enabled
6. Sensor drive current: to set the CH0_IDRIVE field value, read the value from Figure 14 using R_P = 6.6 kΩ. In this case the IDRIVE value should be set to 18 (decimal). The INIT_DRIVE current field should be set to 0x00. The combined value for the DRIVE_CURRENT_CH0 register (addr 0x1E) is 0x9000.
7. Program the MUX_CONFIG register
   (a) Set the AUTOSCAN_EN to b1 bit to enable sequential mode
   (b) Set RR_SEQUENCE to b00 to enable data conversion on two channels (channel 0, channel 1)
   (c) Set DEGLITCH to b100 to set the input deglitch filter bandwidth to 3.3MHz, the lowest setting that exceeds the oscillation tank frequency.
   (d) The combined value for the MUX_CONFIG register (address 0x1B) is 0x820C

Typical Application (continued)

8. Finally, program the CONFIG register as follows:
   (a) Set the ACTIVE_CHAN field to b00 to select channel 0.
   (b) Set SLEEP_MODE_EN field to b0 to enable conversion.
   (c) Set RP_OVERRIDE_EN to b1 to disable auto-calibration.
   (d) Set SENSOR_ACTIVATE_SEL = b0, for full current drive during sensor activation
   (e) Set the AUTO_AMP_DIS field to b1 to disable auto-amplitude correction
   (f) Set the REF_CLK_SRC field to b1 to use the external clock source.
   (g) Set the other fields to their default values.
   (h) The combined value for the CONFIG register (address 0x1A) is 0x1601.

   We then read the conversion results for channel 0 and channel 1 every 1000 µs from register addresses 0x00 to 0x03.

8.2.3 Recommended Initial Register Configuration Values

Based on the example configuration in section Detailed Design Procedure, the following register write sequence is recommended:

Table 46. Recommended Initial Register Configuration Values (Single-channel operation)

Address	Value	Register Name	Comments
0x08	0x04D6	RCOUNT_CH0	Reference count calculated from timing requirements (1 kSPS) and resolution requirements
0x10	0x000A	SETTLECOUNT_CH0	Minimum settling time for chosen sensor
0x14	0x1002	CLOCK_DIVIDERS_CH0	CH0_FIN_DIVIDER = 1, CH0_FREF_DIVIDER = 2
0x19	0x0000	ERROR_CONFIG	Can be changed from default to report status and error conditions
0x1B	0x020C	MUX_CONFIG	Enable Ch 0 (continuous mode), set Input deglitch bandwidth to 3.3MHz
0x1E	0x9000	DRIVE_CURRENT_CH0	Sets sensor drive current on ch 0
0x1A	0x1601	CONFIG	Select active channel = ch 0, disable auto-amplitude correction and auto-calibration, enable full current drive during sensor activation, select external clock source, wake up device to start conversion. This register write must occur last because device configuration is not permitted while the LDC is in active mode.

Table 47. Recommended Initial Register Configuration Values (Multi-channel operation)

Address	Value	Register Name	Comments
0x08	0x04D6	RCOUNT_CH0	Reference count calculated from timing requirements (1 kSPS) and resolution requirements
0x09	0x04D6	RCOUNT_CH1	Reference count calculated from timing requirements (1 kSPS) and resolution requirements
0x10	0x000A	SETTLECOUNT_CH0	Minimum settling time for chosen sensor
0x11	0x000A	SETTLECOUNT_CH1	Minimum settling time for chosen sensor
0x14	0x1002	CLOCK_DIVIDERS_CH0	CH0_FIN_DIVIDER = 1, CH0_FREF_DIVIDER = 2
0x15	0x1002	CLOCK_DIVIDERS_CH1	CH1_FIN_DIVIDER = 1, CH1_FREF_DIVIDER = 2
0x19	0x0000	ERROR_CONFIG	Can be changed from default to report status and error conditions
0x1B	0x820C	MUX_CONFIG	Enable Ch 0 and Ch 1 (sequential mode), set Input deglitch bandwidth to 3.3MHz
0x1E	0x9000	DRIVE_CURRENT_CH0	Sets sensor drive current on ch 0
0x1F	0x9000	DRIVE_CURRENT_CH1	Sets sensor drive current on ch 1

Table 47. Recommended Initial Register Configuration Values (Multi-channel operation) (continued)

Address	Value	Register Name	Comments
0x1A	0x1601	CONFIG	disable auto-amplitude correction and auto-calibration, enable full current drive during sensor activation, select external clock source, wake up device to start conversion. This register write must occur last because device configuration is not permitted while the LDC is in active mode.

8.2.4 Application Curves

Common test conditions (unless specified otherwise):

• Sensor inductor: 2 layer, 32 turns/layer, 14mm diameter, PCB inductor with L=19.4 µH, RP=5.7 kΩ at 2 MHz
• Sensor capacitor: 330pF 1% COG/NP0
• Target: Aluminum, 1.5 mm thickness
• Channel = Channel 0 (continuous mode)
• CLKIN = 40MHz, CHx_FIN_DIVIDER = 0x01, CHx_FREF_DIVIDER = 0x001
• CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100
• RP_OVERRIDE = 1, AUTO_AMP_DIS = 1, DRIVE_CURRENT_CH0 = 0x9800

Figure 65. Measurement precision in Distance vs. Target Distance (0 to 30mm)

Figure 66. Measurement precision in Distance vs. Target Distance (0 to 10mm)

8.2.5 Inductor Self-Resonant Frequency

Every inductor has a distributed parasitic capacitance, which is dependent on construction and geometry. At the Self-Resonant Frequency (SRF), the reactance of the inductor cancels the reactance of the parasitic capacitance. Above the SRF, the inductor will electrically appear to be a capacitor. Because the parasitic capacitance is not well-controlled or stable, it is recommended that: $f_{SENSOR} < 0.8 \times f_{SR}$.
Figure 67. Example Coil Inductance vs. Frequency

In Figure 67, the inductor has a SRF at 6.38 MHz; therefore the inductor should not be operated above 0.8×6.38 MHz, or 5.1 MHz.

9 Power Supply Recommendations

- The LDC requires a voltage supply within 2.7 V and 3.6 V. A multilayer ceramic bypass X7R capacitor of 1µF between the VDD and GND pins is recommended. If the supply is located more than a few inches from the LDC, additional bulk capacitance may be required in addition to the ceramic bypass capacitor. An electrolytic capacitor with a value of 10µF is a typical choice.
- The optimum placement is closest to the VDD and GND terminals of the device. Care should be taken to minimize the loop area formed by the bypass capacitor connection, the VDD terminal, and the GND terminal of the IC. See Figure 68 and Figure 68 for a layout example.

10 Layout

10.1 Layout Guidelines

Avoid long traces to connect the sensor to the LDC. Short traces reduce parasitic capacitances between sensor inductor and offer higher system performance.

10.2 Layout Example

Figure 68 to Figure 71 show the LDC1612 evaluation module (EVM) layout.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate
   design recommendations.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
