TEXAS INSTRUMENTS

LMP91200

SNAS571E – JANUARY 2012 – REVISED FEBRUARY 2016

LMP91200 Configurable AFE for Low-Power Chemical-Sensing Applications

1 Features

- Active Guarding
- Key Specifications
  - Unless otherwise noted, typical values at T_A = 25°C, V_S = (VDD-GND) = 3.3 V
  - pH Buffer Input Bias Current (0 < V_{INP} < 3.3 V)
    - Maximum at 25°C: ±125 fA
    - Maximum at 85°C: ±445 fA
  - pH Buffer Input Bias Current (-500 mV < $V_{INP}- V_{CM}$ < 500 mV), V_S = (VDD – GND) = 0 V
    - Maximum at 25°C: ±600 fA
    - Maximum at 85°C: ±6.5 pA
  - pH Buffer Input Offset Voltage: ±200 µV
  - pH Buffer Input Offset Voltage Drift: ±2.5 µV/°C
  - Supply Current: 50 µA
  - Supply Voltage: 1.8 V to 5.5 V
  - Operating Temperature Range: –40°C to 125°C
  - Package: 16-Pin TSSOP

2 Applications

- pH Sensor Platforms

3 Description

The LMP91200 device is a sensor AFE for use in low-power, analytical-sensing applications. The LMP91200 is designed for 2-electrode sensors. This device provides all of the functionality needed to detect changes based on a delta voltage at the sensor. Optimized for low-power applications, the LMP91200 works over a voltage range of 1.8 V to 5.5 V. With its extremely low input bias current it is optimized for use with pH sensors. Also, in absence of supply voltage the very low input bias current reduces degradation of the pH probe when connected to the LMP91200. Two guard pins provide support for high parasitic impedance wiring. Depending on the configuration, total current consumption for the device is 50 µA while measuring pH. Available in a 16-pin TSSOP package, the LMP91200 operates from –40°C to +125°C.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMP91200	TSSOP (16)	5.00 mm × 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.
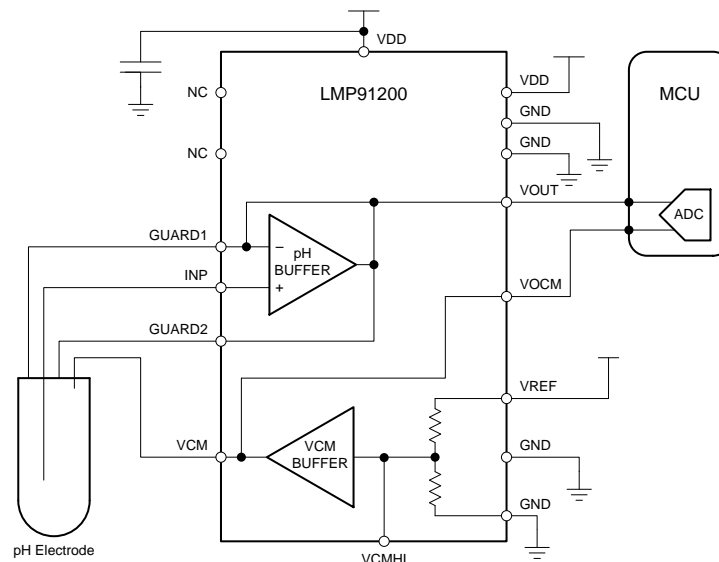

Typical Application

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (November 2015) to Revision E   **Page**

- Deleted SPI Function 1

Changes from Revision C (March 2013) to Revision D   **Page**

- Added *Pin Configuration and Functions* section, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section 1
- Deleted temperature sensor function. 1

Changes from Revision B (March 2013) to Revision C   **Page**

- Changed layout of National Data Sheet to TI format 17

5 Pin Configuration and Functions

Pin Functions[1]

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	VDD	P	Positive Power Supply
2	NC	A	No connect. These pins should be left floating
3	NC	A	No connect. These pins should be left floating
4	GUARD1	A	Active guard pin
5	INP	A	Noninverting analog input of pH buffer
6	GUARD2	A	Active guard pin
7	VCMHI	A	High Impedance Common-Mode output
8	VCM	A	Buffered Common-Mode output
9	VREF	A	Voltage reference input
10	GND	G	Analog ground
11	VOCM	A	Output common-mode voltage
12	VOUT	A	Analog Output
13	GND	G	Connect to GND
14	VDD	P	Connect to VDD
15	GND	G	Connect to GND
16	GND	G	Connect to GND

(1) D = Digital, A = Analog, P = Power, G = GND

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1][2][3]

	MIN	MAX	UNIT
Supply Voltage (V_S = VDD – GND)	–0.3	6	V
Voltage between any two pins	–0.3	VDD + 0.3	V
Current out at any pin		5	mA
Junction Temperature[4]		150	°C
Storage Temperature, T_{stg}	–65	150	°C

(1)   Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2)   For soldering specifications see product folder at www.ti.com and SNOA549.
(3)   If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
(4)   The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$. The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A)/R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge[1]	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[2]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[3]	±1000	
		Machine Model	±150	

(1)   Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).
(2)   JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(3)   JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply Voltage (V_S = VDD – GND)	1.8	5.5	V
Temperature	–40	125	°C

6.4 Thermal Information

	THERMAL METRIC[1]	LMP91200 PW (TSSOP) 16 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	31	°C/W

(1)   For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics

Unless otherwise specified, all limits specified for T_A = 25°C. V_S = (VDD – GND) = 3.3 V. VREF = 3.3 V.[1][2][3]

PARAMETER		TEST CONDITIONS		MIN[4]	TYP[5]	MAX[4]	UNIT

(1) Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that T_J = T_A. No specification of parametric performance is indicated in the electrical tables under conditions of internal self-heating where T_J >T_A.
(2) Positive current corresponds to current flowing into the device.
(3) The voltage on any pin should not exceed 6 V relative to any other pins.
(4) Limits are 100% production tested at 25°C. Limits over the operating temperature range are specified through correlations using the Statistical Quality Control (SQC) method.
(5) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not specified on shipped production material.
(6) Boldface limits are production tested at 125°C. Limits are specified through correlations using the Statistical Quality Control (SQC) method.
(7) Excluding all currents which flows out from the device.
(8) Offset voltage average drift is determined by dividing the change in V_{OS} at the temperature extremes by the total temperature change.
(9) This parameter is specified by design and/or characterization and is not tested in production.
(10) Offset voltage long term drift is determined by dividing the change in V_{OS} at time extremes of OPL procedure by the length of the OPL procedure. OPL procedure: 500 hours at 150°C are equivalent to about 15 years.
(11) The short circuit test is a momentary open-loop test.

Electrical Characteristics (continued)

Unless otherwise specified, all limits specified for T_A = 25°C. V_S = (VDD – GND) = 3.3 V. VREF = 3.3 V.[1][2][3]

PARAMETER		TEST CONDITIONS		MIN[4]	TYP[5]	MAX[4]	UNIT
VCM BUFFER							
VCMHI_acc	VCMHI accuracy			−1.6		1.6	mV

7 Detailed Description

7.1 Overview

The LMP91200 is a sensor AFE for use in low-power, analytical-sensing applications. The LMP91200 is designed for 2-electrode sensors. This device provides all of the functionality needed to detect changes based on a delta voltage at the sensor. Optimized for low-power applications, the LMP91200 works over a voltage range of 1.8 V to 5.5 V. With its extremely low input bias current, it is optimized for use with pH sensors. Also, in the absence of supply voltage, the very low input bias current reduces degradation of the pH probe when connected to the LMP91200. Two guard pins provide support for high parasitic impedance wiring.

7.2 Functional Block Diagram
7.3 Feature Description

7.3.1 pH Buffer

The pH Buffer is a unity gain buffer with a input bias current in the range of tens fA at room temperature. Its very low bias current introduces a negligible error in the measurement of the pH. The ph buffer is provided with 2 guard pins (GUARD1, GUARD2) in order to minimize the leakage of the input current and to make the design of a guard ring easy.

7.3.2 VCM Buffer

Both buffered and unbuffered version of the common-mode voltage are available respectively at the VCM pin and VCMHI pin. A copy of the buffered version is present at VOCM pin in case of differential measurement.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Theory of pH Measurement

The pH electrode measurements are made by comparing the readings in a sample with the readings in standards whose pH has been defined (buffers). When a pH sensing electrode comes in contact with a sample, a potential develops across the sensing membrane surface and that membrane potential varies with pH. A reference electrode provides a second, unvarying potential to quantitatively compare the changes of the sensing membrane potential. These days, pH electrodes are composed of a sensing electrode with the reference electrode built into the same electrode body, and they are called combination electrodes. A high input impedance meter serves as the readout device and calculates the difference between the reference electrode and sensing electrode potentials in millivolts. The millivolts are then converted to pH units according to the Nernst equation.

Electrode behavior is described by the Nernst equation:

$E = E_o + (2.3\ RT/nF)\ \log\ aH+$

where

- E is the measured potential from the sensing electrode,
- Eo is related to the potential of the reference electrode,
- (2.3 RT/nF) is the Nernst factor,
- log aH+ is the pH, (aH+ = activity of Hydrogen ions). (1)

2.3 RT/nF includes the Gas Law constant (R), Faraday's constant (F), the temperature in degrees Kelvin (T) and the stoichiometric number of ions involved in the process (n). For pH, where n = 1, the Nernst factor is 2.3 RT/F. Because R and F are constants, the factor and therefore electrode behavior is dependent on temperature. The Nernst Factor is equivalent to the electrode slope which is a measure of the electrode response to the ion being detected. When the temperature is 25°C, the theoretical Nernst slope is 59.16 mV/pH unit.

8.2 Typical Application
Figure 34. Typical Application

Typical Application (continued)

8.2.1 Design Requirements

8.2.1.1 pH Measurement

The output of a pH electrode ranges from 415 mV to −415 mV as the pH changes from 0 to 14 at 25°C. The output impedance of a pH electrode is extremely high, ranging from 10 MΩ to 1000 MΩ. The low input bias current of the LMP91200 allows the voltage error produced by the input bias current and electrode resistance to be minimal. For example, if the output impedance of the pH electrode used is 10 MΩ and an operational amplifier with 3 nA of Ibias is used, the error caused due to the input bias current of the amplifier and the source resistance of the pH electrode is 30 mV! This error can be greatly reduced to 1.25 µV by using the LMP91200.

The pH measurement with the LMP91200 is straightforward. The pH electrode must be connected between the VCM pin and the INP pin. The voltage at the VCM pin represents the internal zero of the system so the potential of the electrode (voltage at INP pin) will be referred to the VCM voltage.

8.2.2 Detailed Design Procedure

The LMP91200 is configured to execute a pH measurement as described in the *pH Measurement* section.

8.2.3 Application Curves

Figure 36. PGA Time Domain Voltage Noise
Figure 37. PGA PSRR vs Frequency

Product Folder Links: *LMP91200*

9   Power Supply Recommendations

VDD should be bypassed with 10-µF, 1-µF and 0.1-µF capacitors, placed as close as possible to the LMP91200 VDD pin (pin 1). An LDO is recommended for the supply rail, but a DC-DC switcher may be used if sufficient filtering is used to attenuate the switching frequency components.

10   Layout

10.1   Layout Guidelines

Due to the high impedance of the ph Electrode in the pH measurement, careful circuit layout and assembly are required. Guarding techniques are highly recommended to reduce parasitic leakage current by isolating the input of the LMP91200 from large voltage gradients across the PCB. A guard is a low impedance conductor that surrounds an input line and its potential is raised to the voltage of the input line. The input pin should be fully guarded as shown in Figure 38. The guard traces should completely encircle the input connections. In addition, they should be located on both sides of the PCB and be connected together. The LMP91200 makes the guard ring easy to be implemented without any other external operational amplifier. The ring needs to be connected to the guard pins (GUARD1 and GUARD2), which are at the same potential as that of the INP pin. Solder mask should not cover the input and the guard area, including guard traces on either side of the PCB. Sockets are not recommended as they can be a significant leakage source. After assembly, a thorough cleaning using commercial solvent is necessary.

Figure 38 shows a typical guard ring circuit when the LMP912000 is interfaced to a pH probe through a triaxial cable/connector (usually referred to as *triax*). The signal conductor and the guard of the triax should be kept at the same potential. Therefore, the leakage current between them is practically zero. Because the triax has an extra layer of insulation and a second conducting sheath, it offers greater rejection of interference than coaxial cable or connector.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PACKAGE MATERIALS INFORMATION

TAPE AND REEL INFORMATION

REEL DIMENSIONS

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMP91200MTX/NOPB	TSSOP	PW	16	2500	330.0	12.4	6.95	5.6	1.6	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)

PW (R−PDSO−G16)   PLASTIC SMALL OUTLINE
4040064−4/G 02/11

NOTES: A.   All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M−1994.
         B.   This drawing is subject to change without notice.
         C.   Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall
              not exceed 0,15 each side.
         D.   Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
         E.   Falls within JEDEC MO−153

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
