

# Dual, Quad, and Hex High-Speed Differential ESD-Protection ICs

## General Description

The MAX3205E/MAX3207E/MAX3208E low-capacitance,  $\pm 15\text{kV}$  ESD-protection diode arrays with an integrated transient voltage suppressor (TVS) clamp are suitable for high-speed and general-signal ESD protection. Low input capacitance makes these devices ideal for ESD protection of signals in HDTV, PC monitors (DVI™, HDMI™), PC peripherals (FireWire®, USB 2.0), server interconnect (PCI Express™, Infiniband®), datacom, and interchassis interconnect. Each channel consists of a pair of diodes that steer ESD current pulses to VCC or GND.

The MAX3205E/MAX3207E/MAX3208E protect against ESD pulses up to  $\pm 15\text{kV}$  Human Body Model,  $\pm 8\text{kV}$  Contact Discharge, and  $\pm 15\text{kV}$  Air-Gap Discharge, as specified in IEC 61000-4-2. An integrated TVS ensures that the voltage rise seen on VCC during an ESD event is clamped to a known voltage. These devices have a 2pF input capacitance per channel, and a channel-to-channel capacitance variation of only 0.05pF, making them ideal for use on high-speed, single-ended, or differential signals.

The MAX3207E is a two-channel device suitable for USB 1.1, USB 2.0 (480Mbps), and USB OTG applications. The MAX3208E is a four-channel device for Ethernet and FireWire applications. The MAX3205E is a six-channel device for cell phone connectors and SVGA video connections.

The MAX3205E is available in 9-bump, tiny chip-scale (UCSP™), and 16-pin, 3mm x 3mm, thin QFN packages. The MAX3207E is available in a small 6-pin SOT23 package. The MAX3208E is available in 10-pin  $\mu$ MAX® and 16-pin, 3mm x 3mm TQFN packages. All devices are specified for the -40°C to +125°C automotive operating temperature range.

## Applications

- DVI Input/Output Protection
- Set-Top Boxes
- PDAs/Cell Phones
- Graphics Controller Cards
- Displays/Projectors
- High-Speed, Full-Speed and Low-Speed USB Port Protection
- FireWire IEEE 1394 Ports
- Consumer Equipment
- High-Speed Differential Signal Protection

*Typical Operating Circuit and Pin Configurations appear at end of data sheet.*

## Features

- ♦ Low Input Capacitance of 2pF Typical
- ♦ Low Channel-to-Channel Variation of 0.05pF from I/O to I/O
- ♦ High-Speed Differential or Single-Ended ESD Protection
  - ±15kV-Human Body Model
  - ±8kV-IEC 61000-4-2, Contact Discharge
  - ±15kV-IEC 61000-4-2, Air-Gap Discharge
- ♦ Integrated Transient Voltage Suppressor (TVS)
- ♦ Optimized Pinout for Minimized Stub Instances on Controlled-Impedance Differential-Transmission Line Routing
- ♦ -40°C to +125°C Automotive Operating Temperature Range
- ♦ UCSP Packaging Available

## Detailed Description

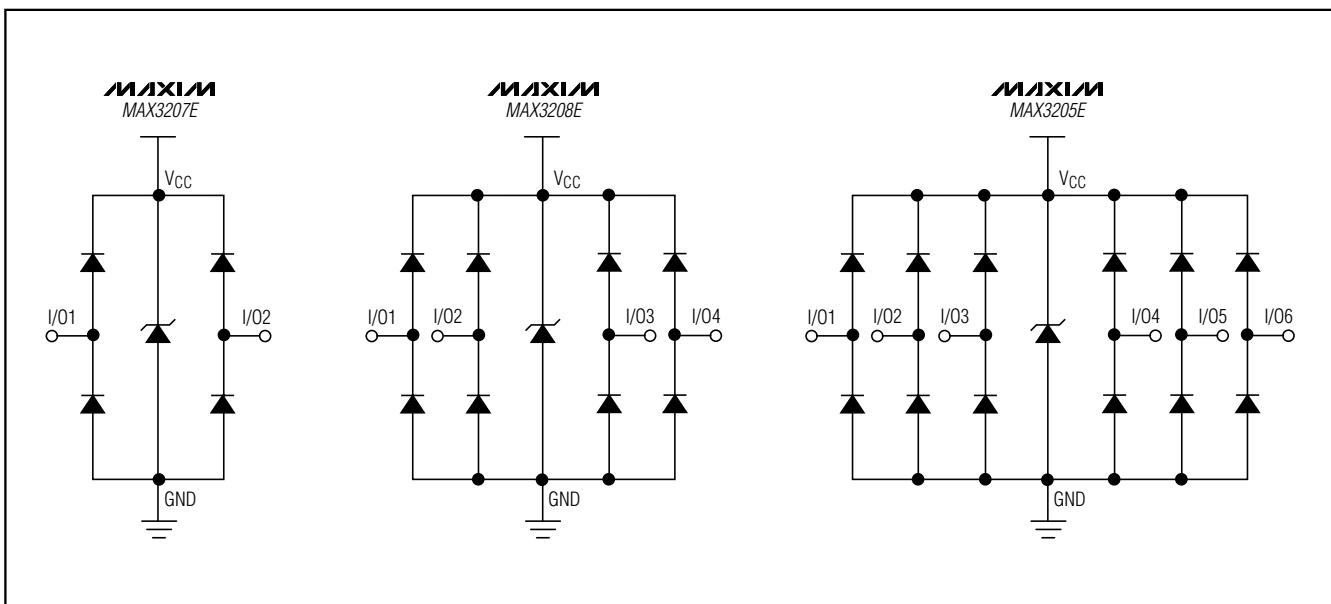

The MAX3205E/MAX3207E/MAX3208E low-capacitance,  $\pm 15\text{ kV}$  ESD-protection diode arrays with an integrated transient voltage suppressor (TVS) clamp are suitable for high-speed and general-signal ESD protection. Low input capacitance makes these devices ideal for ESD protection of signals in HDTV, PC monitors (DVI, HDMI), PC peripherals (FireWire, USB 2.0), Server Interconnect (PCI Express, Infiniband), Datacom, and Inter-Chassis Interconnect. Each channel consists of a pair of diodes that steer ESD current pulses to VCC or GND. The MAX3205E, MAX3207E, and MAX3208E are two, four, and six channels (see the *Functional Diagram*).

The MAX3205E/MAX3207E/MAX3208E are designed to work in conjunction with a device's intrinsic ESD protection. The MAX3205E/MAX3207E/MAX3208E limit the

excursion of the ESD event to below  $\pm 25\text{V}$  peak voltage when subjected to the Human Body Model waveform. When subjected to the IEC 61000-4-2 waveform, the peak voltage is limited to  $\pm 60\text{V}$  when subjected to Contact Discharge. The peak voltage is limited to  $\pm 100\text{V}$  when subjected to Air-Gap Discharge. The device protected by the MAX3205E/MAX3207E/MAX3208E must be able to withstand these peak voltages, plus any additional voltage generated by the parasitic of the board.

A TVS is integrated into the MAX3205E/MAX3207E/MAX3208E to help clamp ESD to a known voltage. This helps reduce the effects of parasitic inductance on the Vcc rail by clamping Vcc to a known voltage during an ESD event. For the lowest possible clamp voltage during an ESD event, placing a  $0.1\mu\text{F}$  capacitor as close to Vcc as possible is recommended.

# Dual, Quad, and Hex High-Speed Differential ESD-Protection ICs

## Applications Information

### Design Considerations

Maximum protection against ESD damage results from proper board layout (see the *Layout Recommendations* section). A good layout reduces the parasitic series inductance on the ground line, supply line, and protected signal lines. The MAX3205E/MAX3207E/MAX3208E ESD diodes clamp the voltage on the protected lines during an ESD event and shunt the current to GND or V<sub>CC</sub>. In an ideal circuit, the clamping voltage (V<sub>C</sub>) is defined as the forward voltage drop (V<sub>F</sub>) of the protection diode, plus any supply voltage present on the cathode.

For positive ESD pulses:

$$V_C = V_{CC} + V_F$$

For negative ESD pulses:

$$V_C = -V_F$$

The effect of the parasitic series inductance on the lines must also be considered (Figure 1).

For positive ESD pulses:

$$V_C = V_{CC} + V_{F(D1)} + \left( L_1 \times \frac{d(I_{ESD})}{dt} \right) + \left( L_2 \times \frac{d(I_{ESD})}{dt} \right)$$

For negative ESD pulses:

$$V_C = - \left( V_{F(D2)} + \left( L_1 \times \frac{d(I_{ESD})}{dt} \right) + \left( L_3 \times \frac{d(I_{ESD})}{dt} \right) \right)$$

where, I<sub>ESD</sub> is the ESD current pulse.

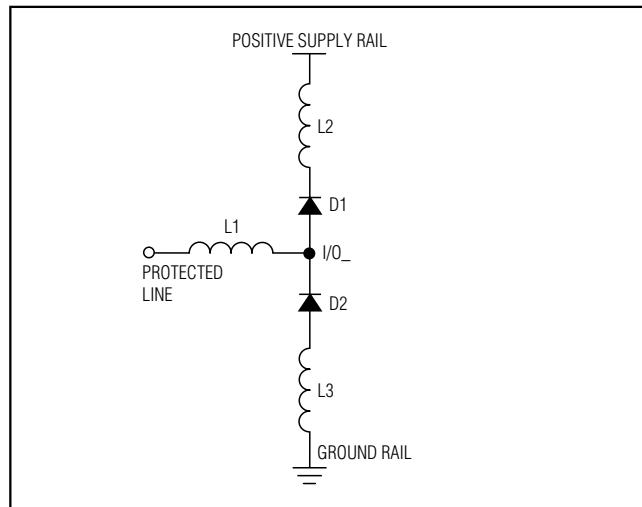

Figure 1. Parasitic Series Inductance

During an ESD event, the current pulse rises from zero to peak value in nanoseconds (Figure 2). For example, in a 15kV IEC-61000 Air-Gap Discharge ESD event, the pulse current rises to approximately 45A in 1ns ( $dI/dt = 45 \times 10^9$ ). An inductance of only 10nH adds an additional 450V to the clamp voltage, and represents approximately 0.5in of board trace. Regardless of the device's specified diode clamp voltage, a poor layout with parasitic inductance significantly increases the effective clamp voltage at the protected signal line. Minimize the effects of parasitic inductance by placing the MAX3205E/MAX3207E/MAX3208E as close to the connector (or ESD contact point) as possible.

A low-ESR 0.1μF capacitor is recommended between V<sub>CC</sub> and GND in order to get the maximum ESD protection possible. This bypass capacitor absorbs the charge transferred by a positive ESD event. Ideally, the supply rail (V<sub>CC</sub>) would absorb the charge caused by a positive ESD strike without changing its regulated value. All power supplies have an effective output impedance on their positive rails. If a power supply's effective output impedance is 1Ω, then by using  $V = I \times R$ , the clamping voltage of V<sub>C</sub> increases by the equation  $V_C = I_{ESD} \times R_{OUT}$ . A +8kV IEC 61000-4-2 ESD event generates a current spike of 24A. The clamping voltage increases by  $V_C = 24A \times 1\Omega$ , or  $V_C = 24V$ . Again, a poor layout without proper bypassing increases the clamping voltage. A ceramic chip capacitor mounted as close as possible to the MAX3205E/MAX3207E/MAX3208E V<sub>CC</sub> pin is the best choice for this application. A bypass capacitor should also be placed as close to the protected device as possible.

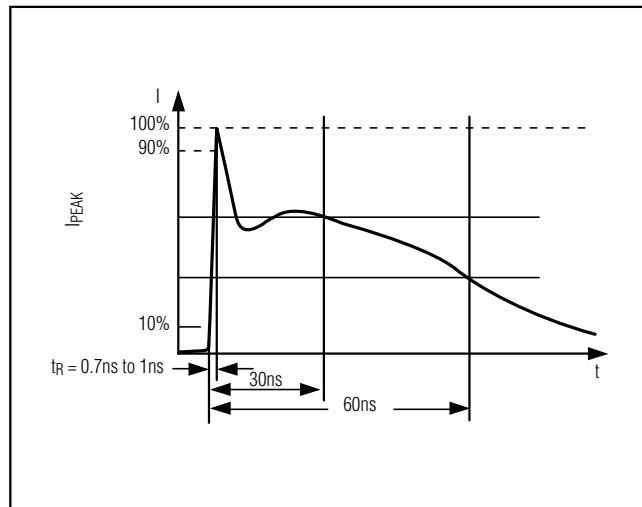

Figure 2. IEC 61000-4-2 ESD Generator Current Waveform

# Dual, Quad, and Hex High-Speed Differential ESD-Protection ICs

## **±15kV ESD Protection**

ESD protection can be tested in various ways. The MAX3205E/MAX3207E/MAX3208E are characterized for protection to the following limits:

- ±15kV using the Human Body Model
- ±8kV using the Contact Discharge Method specified in IEC 61000-4-2
- ±15kV using the IEC 61000-4-2 Air-Gap Discharge Method

## **ESD Test Conditions**

ESD performance depends on a number of conditions. Contact Maxim for a reliability report that documents test setup, methodology, and results.

## **Human Body Model**

Figure 3 shows the Human Body Model, and Figure 4 shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the device through a 1.5kΩ resistor.

## **IEC 61000-4-2**

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. The MAX3205E/MAX3207E/MAX3208E help users design equipment that meets Level 4 of IEC 61000-4-2. The main difference between tests done using the Human Body Model

and IEC 61000-4-2 is higher peak current in IEC 61000-4-2. Because series resistance is lower in the IEC 61000-4-2 ESD test model (Figure 5), the ESD-withstand voltage measured to this standard is generally lower than that measured using the Human Body Model. Figure 2 shows the current waveform for the ±8kV, IEC 61000-4-2 Level 4, ESD Contact Discharge test. The Air-Gap Discharge test involves approaching the device with a charged probe. The Contact Discharge method connects the probe to the device before the probe is energized.

## Layout Recommendations

Proper circuit-board layout is critical to suppress ESD-induced line transients (See Figure 6). The MAX3205E/MAX3207E/MAX3208E clamp to 100V; however, with improper layout, the voltage spike at the device can be much higher. A lead inductance of 10nH with a 45A current spike results in an additional 450V spike on the protected line. It is essential that the layout of the PC board follows these guidelines:

- 1) Minimize trace length between the connector or input terminal, I/O<sub>-</sub>, and the protected signal line.
- 2) Use separate planes for power and ground to reduce parasitic inductance and to reduce the impedance to the power rails for shunted ESD current.
- 3) Ensure short low-inductance ESD transient return paths to GND and VCC.
- 4) Minimize conductive power and ground loops.
- 5) Do not place critical signals near the edge of the PC board.
- 6) Bypass VCC to GND with a low-ESR ceramic capacitor as close to VCC as possible.

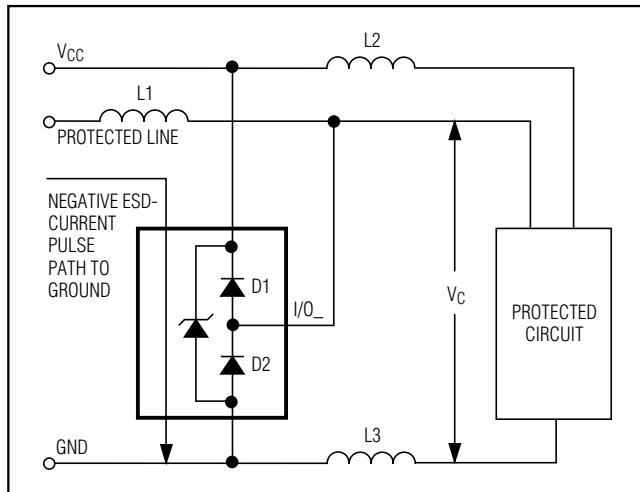

Figure 6. Layout Considerations

- 7) Bypass the supply of the protected device to GND with a low-ESR ceramic capacitor as close to the supply pin as possible.

## UCSP Applications Information

For the latest application details on UCSP construction, dimensions, tape carrier information, printed circuit board techniques, bump-pad layout, and recommended reflow temperature profile, as well as the latest information on reliability testing results, go to the Maxim website at [www.maxim-ic.com/ucsp](http://www.maxim-ic.com/ucsp) for the Application Note, *UCSP—A Wafer-Level Chip-Scale Package*.
