

Ultra-Low Leakage Monolithic CMOS Analog Multiplexers

MAX328/MAX329

General Description

The MAX328/MAX329 are monolithic CMOS analog multiplexers. The MAX328 is a single-ended, 1-of-8 device, and the MAX329 is a differential, 2-of-8 device.

Designed to provide the lowest possible "on" and "off" leakages, these multiplexers switch signals from high source impedance, providing the mux operates into a high input impedance op amp or A/D converter. The MAX328/MAX329 are pin-for-pin replacements for the popular DG508/DG509 in these applications.

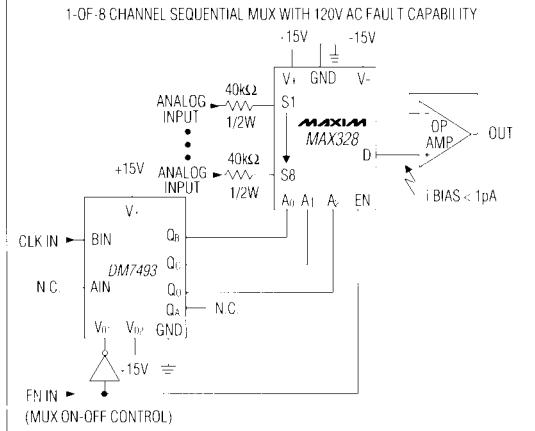

Adding an external $40k\Omega$ resistor to each input makes the MAX328/MAX329 an excellent fault-tolerant multiplexer. Low leakage (less than 1pA at 25°C) and $2.5k\Omega$ on resistance allow the circuit to sustain 110V AC faults indefinitely while maintaining an error of less than 40nV for normal signals (i.e., 1pA times $40k\Omega$).

The MAX328/MAX329 work equally well with a single supply of 10V to 30V or dual supplies of $\pm 5\text{V}$ to $\pm 18\text{V}$. They also perform well with unbalanced combinations of supply voltage, such as $+12\text{V}$ and -5V or $+5\text{V}$ and -15V . Low-power dissipation (1.9mW with $\pm 15\text{V}$ supplies) allows use of the multiplexers in portable applications.

Applications

- Control Systems
- Data Logging Systems
- Aircraft Heads-Up Displays
- Data Acquisition Systems
- Signal Routing

Typical Operating Circuit

Features

- ◆ Ultra-Low "Off" and "On" Leakage: 1pA Typ
- ◆ Bi-Directional Operation (Use as Mux or Demux)
- ◆ TTL and CMOS Logic Compatibility
- ◆ Analog-Signal Range Includes Power-Supply Rails
- ◆ Switching Speeds Less Than $1.5\mu\text{s}$
- ◆ Pin Compatible With DG508/DG509 and MAX358/MAX359
- ◆ Latch-Up Proof Construction

Ultra-Low Leakage Monolithic CMOS Analog Multiplexers

ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to V-		Operating Temperature Range:
V+	+44V	MAX328/329 C 0 C to +70 C
GND	+25V	MAX328/329 E -40 C to +85 C
Digital Inputs (Note 1), VS, VD	-2V to (V+ + 2V)	MAX328/329 M -55 C to +125 C
Current (Any Terminal, Except S or D)	30mA	
Continuous Current, S or D	10mA	
Peak Current, S or D (Pulsed at 1ms, 10% Duty Cycle Max)	40mA	
		Power Dissipation (Package) (Note 1)
		16-Pin CERDIP (Note 2) 900mW
		16-Pin Plastic DIP (Note 3) 470mW
		16-Pin Wide SO (Note 4) 750mW
		Storage Temperature -65 C to +150 C

Stresses listed under "Absolute Maximum Ratings" may be applied (one at a time) to devices without resulting in permanent damage. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V+ = +15V, V- = -15V, GND = 0V, TA = +25°C, unless otherwise noted.)

MAX328/MAX329

Note 1: All leads soldered or welded to PC board.

Note 2: Derate 12mW/ $^\circ C$ above $+75^\circ C$.

Note 3: Derate 6.3mW/ $^\circ C$ above $+75^\circ C$.

Note 4: Derate 10mW/ $^\circ C$ above $+75^\circ C$.

Note 5: All leakage parameters are 100% tested at maximum rated operating temperature, i.e., $+70^\circ C$, $+85^\circ C$, $+125^\circ C$, and guaranteed by correlation at $+25^\circ C$.

Note 6: Electrical characteristics, such as On Resistance, will change when power supplies other than $\pm 15V$ are used. Power-supply range is a design characteristic, not production tested.

Note 7: Guaranteed by design.

Typical values are for DESIGN AID ONLY, not guaranteed or subject to production testing.

Typical Operating Characteristics

Ultra-Low Leakage Monolithic CMOS Analog Multiplexers

Application Notes

Figure 4 is a typical circuit for converting the MAX328/MAX329 into a fault-tolerant mux. In this application, the internal diodes limit the voltage at the MAX328 input to $\pm 15.7V$ ($\pm 15V$ supplies). No external diodes need to be added with the MAX328/MAX329, unlike conventional multiplexers requiring external diodes.

The resistors, R, need to be $39k\Omega$ or higher to limit the power dissipation in the resistor when a 120V AC fault occurs (i.e., power dissipation is $(120-16)^2/39k\Omega$ or 0.28W. This is why a 1/2W resistor is needed). The circuit withstands an indefinite fault to a 120V AC line with no damage to any component.

In addition to allowing fault-protection, the guaranteed low leakage of the MAX328/MAX329 also reduces signal errors. The circuit in Figure 4 produces an error voltage of $10pA$ (max leakage) $\times 39k\Omega$ or $0.39\mu V$ at room temperature and $39\mu V$ at $+125^\circ C$. Therefore, for 10V signals, the MAX328/MAX329 allows 17-bit resolution ($38\mu V = 1LSB$) over the full temperature range.
