

+10V Precision Voltage Reference

MAX674

General Description

The MAX674 is a precision voltage reference that is pretrimmed to within $\pm 0.15\%$ of 10V. The reference features excellent temperature stability (as low as 12.0ppm/ $^{\circ}\text{C}$ guaranteed), low current drain, and low noise. It is supplied in the space-saving narrow SO package, as well as, the standard 8-pin plastic DIP package.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: Temperature coefficient is measured by the "box" method, i.e., the maximum ΔV_{OUT} is divided by ΔT.

Note 2: Line and load regulation specifications include the effect of self-heating.

Note 3: Guaranteed by design for MAX674CPA, MAX674CSA, MAX674EPA, MAX674ESA; sample tested for all other grades and packages.

Output Adjustment

The MAX674 trim terminal can be used to adjust the output voltage over a 10V \pm 300mV range. This feature allows system errors to be trimmed by setting the reference to a voltage other than 10V such as 10.240V for binary applications (see the *Typical Operating Circuit*). The trim terminal may, of course, be left open if no adjustment is needed.

Adjustment of the output does not significantly affect the temperature performance of the device. The temperature coefficient change is approximately 0.7ppm/ $^{\circ}$ C for 100mV of output adjustment from its initial value.
