MSP430[™] Ultra-Low-Power Microcontrollers

MSP430[™] Microcontrollers

MSP430 Microcontrollers (MCUs) from Texas Instruments (TI) are 16-bit, RISC-based, mixed-signal processors designed specifically for ultra-low-power. MSP430 MCUs have the right mix of intelligent peripherals, ease-of-use, low cost and lowest power consumption for thousands of applications – including yours. TI offers robust design support for the MSP430 MCU platform along with technical documents, training, tools and software to help designers develop products and release them to market faster. Learn more at **www.ti.com/msp430**.

MSP430 Microcontroller DNA

Ultra-Low Power

The MSP430 MCU is designed specifically for ultra-low-power applications. Its flexible clocking system, multiple low-power modes, instant wakeup and intelligent autonomous peripherals enable true ultra-low-power optimization, dramatically extending battery life.

Flexible Clocking System – The MSP430 MCU clock system has the ability to enable and disable various clocks and oscillators which allow the device to enter various low-power modes (LPMs). The flexible clocking system optimizes overall current consumption by only enabling the required clocks when appropriate.

Main Clock (MCLK) – CPU source that may be driven by the internal Digitally Controlled Oscillator (DCO) up to 25 MHz or with external crystal.

Auxiliary Clock (ACLK) – Source for individual peripheral modules driven by the internal low-power oscillator or external crystal.

Key Features

- Ultra-low-power (ULP) architecture and flexible clock system extend battery life: 0.1-μA RAM retention, <1-μA RTC mode, <100 μA MHz
- Integrated intelligent peripherals including a wide range of high-performance analog and digital peripherals that off-load the CPU
- Easy-to-use 16-bit RISC CPU architecture enables new applications with industry-leading code density
- Complete development ecosystem with tools starting at \$4.30
- Enhanced libraries to benefit several applications such as capacitive touch, metering metrology, low power design and debugging

400+ Ultra-Low-Power Devices

8-MHz to 25-MHz CPU Speed 0.5KB to 256KB Flash 128B to 18KB RAM 14 to 113 pins; 25+ packages

Sub-Main Clock (SMCLK) – Source for faster individual peripheral modules that may be driven by the internal DCO up to 25 MHz or with external crystal.

Instant Wakeup – The MSP430 MCU can wake-up instantly from LPMs. This ultra-fast wake-up is enabled by the MSP430 MCU's internal digitally controlled oscillator (DCO), which can source up to 25 MHz and be active and stable in 1 μ s. Instant wake-up functionality is important in ultra-low-power applications since it allows the microcontroller to use the CPU in very efficient bursts and spend more time in LPMs.

Zero-Power Brown-Out Reset (BOR) – The MSP430 MCU's BOR is always enabled and active in all modes of operation. This ensures the most reliable performance possible while maintaining ultra-lowpower consumption. The BOR circuit detects low supply voltages and resets the device when power is applied or removed. This functionality is especially critical in battery-powered applications.

Ultra-fast 1-µs DCO start-up allows MSP430-based systems to remain in low-power modes for the longest possible interval – extending battery life. The DCO is fully user programmable.

MSP430[™] Microcontroller DNA

Highly Integrated

MSP430 MCUs are highly integrated and offer a wide range of highperformance analog and digital peripherals.

Intelligent Peripherals

The MSP430 MCUs peripherals have been designed to assure maximum functionality and provide system-level interrupts, resets and bus arbitration at the lowest power. Many peripherals may function autonomously, thereby minimizing CPU time spent in active mode.

High-Performance Integration

The 400+ MSP430 devices offer high-performance integration including USB, RF, LCD controllers and Sigma-Delta ADCs. The scalable portfolio allows designers to find the appropriate MSP430 device for many lowpower applications. The MSP430 MCU's high integration also enables solutions with smaller physical footprints and minimizes the overall bill of materials.

Easy to Get Started

MSP430 MCUs are easy-to-use because of a modern 16-bit RISC architecture and a simple development ecosystem.

16-Bit Orthogonal Architecture

The MSP430 MCU's 16-bit architecture provides the flexibility of 16 fully-addressable, single-cycle, 16-bit CPU registers with the power of a RISC. The modern design of the CPU offers versatility using only 27 easy-to-understand instructions and seven consistent addressing modes.

Complete Development Ecosystem

The MSP430 development environment is affordable, seamless and easy-to-use. Get started with the \$4.30 MSP430 Value Line LaunchPad development kit, or use the adaptable MSP-FET430UIF that supports development on all MSP430 devices. Also, download free IDE options such as TI's Code Composer Studio[™] IDE, IAR Embedded Workbench or the open-source MSPGCC. MSP430Ware is also available, which is a complete collection of all MSP430 MCU related design resources.

Operating Mode	Description	CPU (MCLK)	SMCLK	ACLK	RAM Retention	BOR	Self Wakeup	Interrupt Sources
Active	CPU, all clocks and peripherals available.	•	•	•	•	•		Timers, ADC, DMA, UART, WDT, I/O, comparator, Ext. Interrupt, RTC, serial communications, other peripherals
LPM0	CPU is shutdown, peripheral clocks available.		•	•	•	•	•	Timers, ADC, DMA, UART, WDT, I/O, comparator, Ext. Interrupt, RTC, serial communications, other peripherals
LPM1	CPU is shutdown, peripheral clocks available. DCO is disabled and the DC generator can be disabled.		•	•	•	•	•	Timers, ADC, DMA, UART, WDT, I/0, comparator, Ext. Interrupt, RTC, serial communications, other peripherals
LPM2	CPU is shutdown, only one peripheral clock available. DC generator is enabled.			•	•	•	•	Timers, ADC, DMA, UART, WDT, I/0, comparator, Ext. Interrupt, RTC, serial communications, other peripherals
LPM3	CPU is shutdown, only one peripheral clock available. DC generator is disabled.			•	•	•	•	Timers, ADC, DMA, UART, WDT, I/0, comparator, Ext. Interrupt, RTC, serial communications, other peripherals
LPM3.5	No RAM retention, RTC can be enabled. (MSP430F5xx generation only)					•	•	Ext. Interrupt, RTC
LPM4	CPU is shutdown and all clocks disabled.				•	•		Ext. Interrupt
LPM4.5	No RAM retention, RTC disabled. (MSP430F5xx generation only)					•		Ext. Interrupt

Why Choose an MSP430[™] Microcontroller?

Ultra-Low Power

The MSP430 MCU is designed specifically for ultra-low-power applications. Its flexible clocking system, multiple low-power modes, instant wakeup and intelligent autonomous peripherals enable true ultra-low-power optimization, dramatically extending battery life.

FRAM

TI is always pushing forward with unique new technologies to decrease power consumption and increase ease-of-use. To those ends we introduce Ferroelectric Random Access Memory (FRAM). FRAM is a universal, non-volatile memory that combines the speed, endurance and flexibility of RAM with the stability and reliability of Flash all in one unified section of memory, while decreasing power consumption.

Multiple Package Options

The MSP430 family offers over 25 packages to best fit end-equipment needs and to facilitate manufacturing. For today's increasing need for miniaturization, MSP430 also supports many devices in bare die and die-sized BGA (DSBGA) packages as small as 3x3 mm.

Easy-to-Use Software

The MSP430 family is supported by a complete and easy software development ecosystem. Free software development environments are available from TI's Code Composer Studio[™] IDE, IAR Embedded Workbench or the open-source MSPGCC. The brand new MSP430Ware is also available, which is a complete collection of all MSP430-related design resources. MSP430 MCUs also have peripheral configuration tools, easy-to-use APIs and other software tools to get you to market faster.

Low-Cost Options

The new MSP430 Value Line series offers ULP and 16-bit performance for low-cost, lower-end applications. Ideal for high-volume/low-cost designs, these MCUs are priced as low as 25 cents. Start developing on MSP430 Value Line devices using the \$4.30 LaunchPad development kit.

Key Applications

The MSP430 MCU's ultra-low-power consumption and powerful analog and digital interfaces can harvest wasted energy from the environment, making it possible to create self-powered systems that eliminate the need to replace batteries. The eZ430-RF2500-SEH is a complete energy harvesting development kit that is available to get you started.

www.ti.com/energyharvesting

TI's integrated communication peripherals and high-performance analog make the MSP430 MCU a great choice for controlling stepper, BLDC, and DC motors in applications like printers, fans, antennas and toys.

www.ti.com/motorcontrol

MSP430 MCUs not only have the lowest power consumption to enable the longest lasting critical devices, but they support features for secure applications like JTAG fuses, custom programming, intelligent power supply monitoring, dedicated watchdog timers, LCD, and highperformance analog. 5

What's New with MSP430[™] Microcontrollers?

FRAM: The future of embedded memory

FRAM, or Ferroelectric Random Access Memory, is a type of nonvolatile memory that combines the speed, ultra-low power, endurance, and flexibility of SRAM with the reliability and stability of flash to combine program and data into one unified memory space for the lowest power and easiest to use microcontroller architecture. www.ti.com/fram

Benefits of Embedded FRAM

Lowest Power

- Industry leading active power consumption of <100µA/MHz
- 250x less power than Flash writes
- Protected write completion

True unified memory

FRAM is the only unified memory in microcontrollers today, that gives developers the flexibility to designate any section of memory as program or data memory. This can be changed throughout the development process to suit the changing needs of the application.

This feature allows faster time to market and simplified inventory management – one single device can be configured into nearly unlimited memory configurations.

Up to 16kB of unified FRAM Reconfigurable as program or data memory

Industry-leading speed

In addition to lower power performance, FRAM can also maintain unmatched data throughput for non-volatile data storage. MSP430 MCUs with embedded FRAM are capable of speeds up to 2 Megabytes/second ensuring that memory is no longer the bottleneck of your application.

FRAM can write more than 100x faster than flash, while consuming less power!

- FRAM max throughput = 2000kB/s
- Flash max throughput = 12kB/s

Virtually unlimited write endurance

Embedded FRAM also offers longevity and endurance that existing memory technologies cannot match. This increased write endurance is particularly ideal for data logging, digital rights management, replacing battery-backed SRAM and other applications.

• 10¹⁵ write cycles for FRAM

Endurance (writes)

What's New with MSP430[™] Microcontrollers?

Ultra-low-power capacitive touch: buttons, sliders, wheels and proximity

Enabling the world's lowest power touch sense capabilities on all MSP430 MCUs, the capacitive touch portfolio includes hardware and free software to give developers easy-to-use, cost effective options for microcontroller-based capacitive touch applications, while still benefitting from the battery-saving features of the MSP430 MCU. www.ti.com/capacitivetouch

MSP430 capacitive touch features:

- Supported by all MSP430 microcontrollers
- Ultra-low-power touch buttons down to 1µA
- Supports buttons, sliders, wheels and proximity sensors
- Free Touch Sense Software Library consuming as little as 1kB
- Cap Sense I/O module available: No external components required

Capacitive Touch Sense Software Library

The royalty-free MSP430 Capacitive Touch Sense Software Library gives developers the option to add touch sense capabilities to any MSP430 microcontroller consuming as little as 1KB of program memory. The open-source software library eliminates the need to develop complex touch sensing algorithms and supports various capacitive touch sensors, including buttons, sliders, wheels and proximity.

MSP-EXP430F5529 Experimenter Board is a fully featured USB development board with sensors, LCD display and a capacitive touch slider.

Introducing the MSP430 MCU's first highresolution Timer D

MSP430F51x2 expands the ultra-low-power portfolio with 5V tolerant IOs.

Ideal for capacitive touch, motor control, LED lighting and power management applications, the new MS430F51x2 series provides two high-precision timers designed for high-precision measurement and control applications, along with 5V tolerant IOs. Each 16-bit precision timer integrates three capture and compare registers and supports high resolution modes running up to 256MHz, equivalent to 4ns resolution.

Timer D also includes a dual capture mode reducing loading of capture operation by half. In addition, the combining compare blocks help to control both rising and falling edges of the PWM output signal. The Timer-Event-Control-block offers external triggering options as well as internal synchronization of timer instances. www.ti.com/430timer

Key features:

- 4ns resolution at 16MHz input clock for PWM output and capture input
- Low-power consumption: 40µA/MHz
- Full PWM capability combining buffered CCR registers for one channel
- Synchronization of Timer instances
- 100% SW compatible to existing Timer_B

MSP430[™] MCU Software Tools

MSP430 is known for providing the world's largest ultra-low-power microcontroller portfolio in the industry or in other words, great hardware. The MSP430 team recognizes that developers also need easy-to-use and powerful software tools to enable high-quality and differentiated applications. The MSP430 software ecosystem can help developers tap into the ultra-low-power performance and intelligent peripherals that are integrated in all 400+ MSP430 devices.

MSP430Ware, featuring Driver Library Everything you need to become an MSP430 MCU expert.

Get the latest and greatest MSP430 MCU design resources in one place.

MSP430Ware is a collection of code examples, datasheets and other design resources for all MSP430 devices delivered in a convenient package; essentially everything you need to become an MSP430 MCU expert.

In addition to providing a complete collection of existing resources, MSP430Ware also includes a brand new high-level API called MSP430 Driver Library. This new library makes it easy to talk to MSP430 hardware. As of today, MSP430 Driver Library supports MSP430F5xx and 6xx devices. Learn more about MSP430Ware at

www.ti.com/msp430ware

Key features:

- MSP430Ware's content is delivered in a sleek, interactive GUI
- · Automatic updates make sure you have the latest resources

The MSP430Ware package includes:

- Code Examples
- Documentation
- Easy-to-use APIs and Driver Libraries

Integrated Development Environments

Code Composer Studio[™] IDE

- · Eclipse-based IDE (Compiler, debugger, link, etc) for all TI embedded processors
- Version 5.1 now available. Faster, more efficient and simple user interface
- Unrestricted version available for \$495
- Free versions are available as well
 - Free 16kB code-limited version available
 - Free, full-featured, 120-day trial version also available

IAR Embedded Workbench

- Third-party IDE offering project management tools and code editor
- Includes up-to-date configuration files for all MSP430 devices
- Free versions are available as well
 - Free 4/8/16kB code-limited Kickstart version available
 - Free, full-featured 30-day trial version available

Open Source MSPGCC and MSPDEBUG

- Free, open source toolchain for MSP430 devices
- Includes the GNU C compiler (GCC), the assembler and linker and the debugger (GDB)
- Tools can be used on Windows, Linux, BSD and most other versions of Unix
- Learn more at mspgcc.sourceforge.net

MSP430[™] MCU Software Tools

The Brand New MSP430 Driver Library

Makes it easy for developers to program MSP430F5xx and 6xx devices using easy-to-use and well-documented function calls; all with minimal footprint. Tap into MSP430 hardware fast and efficiently.

Key features:

- Easy-to-use function calls for enabling, configuring and using peripherals including ADCs, DACs, timers, serial communication modules and more
- Supports MSP430F5xx and F6xx devices today
- Fully documented within a comprehensive API Guide
- Driver Library and documentation delivered within MSP430Ware
- Royalty-free and open source

Get started quickly with Grace code generation

Grace enables developers to generate easy-to-read, fully commented C code that enables and configures peripherals quickly, so developers can spend more time differentiating within the application layer.

Enable peripherals with a single click.

GUI based peripheral configuration.

MSP430 Software Ecosystem

MSP430 offers software solutions and documentation that enable multiple applications such as metering, medical, wireless, energy harvesting, capacitive touch and other applications. See the MSP430 Software Ecosystem in its entirety at www.ti.com/msp430software

Join our online community at www.ti.com/e2e-mcu

MSP430[™] MCU Hardware Tools

MSP430 is supported by a broad collection of hardware development tools, ranging from low-cost development kits like the \$4.30 LaunchPad (MSP-EXP430G2) to highly-integrated, application-specific platforms. MSP430 development kits are carefully put together to ensure a simple "out-of-box" experience to get users beyond "Hello World" within minutes. In addition to a large selection of TI-generated development kits, a growing and active third party network is also available. Happy Coding!

LaunchPad and the BoosterPack Ecosystem

Complete Development kit for \$4.30!

The MSP-EXP430G2 LaunchPad development kit provides all of the hardware and software needed to start MSP430 development. LaunchPad supports all MSP430G2xx Value Line MCUs. www.ti.com/launchpad

LaunchPad Features

- On-board emulation
- 20-pin DIP Socket
- 2 on-board LEDs and 2 on-board switches
- Kit includes USB cable, Quick Start Guide, 2x 10-pin male and female headers
- Includes 2 MSP430 Value Line MCUs
- MSP430G2553: 16kB Flash, 512B RAM, 8ch 10-bit ADC, Comparator, Capacitive Touch I/Os, Universal Serial Communication Module (l²C, UART, SPI)
- MSP430G2452: 8kB Flash, 256B RAM, 8ch 10-bit ADC, Comparator, Capacitive Touch I/Os, Universal Serial Interface (I²C/SPI)

Growing Ecosystem of BoosterPacks!

BoosterPacks are plug-in modules for the LaunchPad development kit, which enable additional functionality including wireless, capacitive touch, LED lighting and others. Each BoosterPack includes hardware, documentation and a pre-programmed MSP430 Value Line device which includes a demo application. See the complete list of BoosterPacks at **www.ti.com/boosterpack**

eZ430 Starter Kits

eZ430 kits feature embedded emulation and unique form factors.

The eZ430 family of tools feature embedded emulation, allowing the kit to be the same size as a USB memory stick and communicate with the target MCU using only 2 pins!

Featuring the eZ430-Chronos[™] development tool

- The world's first wireless development kit in a sports watch
- Integrated with the CC430F6137, an MCU + RF system-on-chip
- Available in three RF frequencies: 433, 868 & 915MHz
- Highly-integrated development platform featuring 3-axis accelerometer, pressure sensor, temp sensor and 96-segment LCD
- Learn more at www.ti.com/chronoswiki

MSP430[™] MCU Hardware Tools

MSP430 Experimenter's Boards

Highly integrated development platforms for evaluating MSP430 devices.

Experimenter's Boards feature selected MSP430 devices and additional hardware components for easy system evaluation and prototyping. They are the ideal platform for learning a new architecture and testing the capabilities of a device family.

MSP-EXP430F5438 Featuring MSP430F5438 on-board dot matrix display, joystick, ZIF socket, RF headers, microphone, accelerometer, JTAG Price: \$149

HSF-EAT430F04010 Featuring MSP430FG4618 and MSP430F2013 on-board segmented display, buzzer, RS-232, capacitive touch, microphone, RF headers, JTAG Price: \$149

Target Boards and Flash Emulation Tools

One tool to rule them all.

The MSP430 Flash Emulation Tool (MSP-FET430UIF) supports all MSP430 devices when paired with the appropriate target board.

Target Boards are available for all MSP430 devices and are fitted with ZIF target sockets for interfacing with various package types and pinouts. The boards provide direct access to all port pins and include an on-board JTAG connector.

A Flash Emulation Tool is required to interface each target board with a PC. The target boards (\sim \$75) and Flash Emulation Tool (\sim \$99) can be purchased separately, or as a bundle (\sim \$149).

MSP-EXP430F5529 Featuring MSP430F5529 complete USB development platform, on-board dot matrix display, UTAG, RF headers, onboard emulation, accelerometer, microSD, capacitive touch Price: \$149

MSP-EXP430FR5739 Featuring MSP430FR5739 on-board emulation, RF headers, accelerometer, temperature sensor, first catalog MCU with embedded FRAM Price: \$29

Important Notice: The products and services of Texas Instruments Incorporated and its subsidiaries described herein are sold subject to TI's standard terms and conditions of sale. Customers are advised to obtain the most current and complete information about TI products and services before placing orders. TI assumes no liability for applications assistance, customer's applications or product designs, software performance, or infringement of patents. The publication of information regarding any other company's products or services does not constitute TI's approval, warranty or endorsement thereof.

B121709

The platform bar, MSP430, eZ430-Chronos, SimplicTI, Code Composer Studio, Grace, SmartRF and C2000 are trademarks of Texas Instruments. The *Bluetooth* word mark and logos are owned by the Bluetooth SIG, Inc., and any use of such marks by Texas Instruments is under license. ARM is a registered trademark of ARM Limited. WiMax is a trademark of the WiMax Forum. ZigBee is a registered trademark of the ZigBee Alliance. All other trademarks are the property of their respective owners.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
