NCV47822

Dual High Side Switch with Adjustable Current Limit and Diagnostic Features

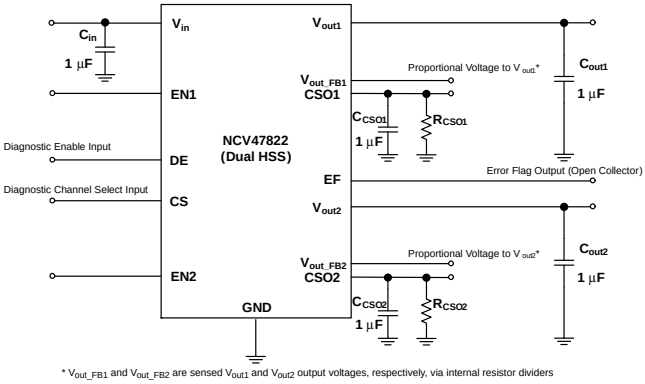
The NCV47822 dual channel High Side Switch (HSS) with 250 mA per channel is designed for use in harsh automotive environments. The device has a high peak input voltage tolerance and reverse input voltage, reverse bias, overcurrent and overtemperature protections. The integrated current sense feature (adjustable by resistor connected to CSO pin for each channel) provides diagnosis and system protection functionality. The CSO pin output current creates voltage drop across CSO resistor which is proportional to output current of each channel. Extended diagnostic features in OFF state are also available and controlled by dedicated input and output pins.

Features

- Output Current per Channel: up to 250 mA
- Two Independent Enable Inputs (3.3 V Logic Compatible)
- Adjustable Current Limits: up to 350 mA
- Protection Features:
  - Current Limitation
  - Thermal Shutdown
  - Reverse Input Voltage and Reverse Bias Voltage
- Diagnostic Features:
  - Short To Battery (STB) and Open Load (OL) in OFF State
  - Internal Components for OFF State Diagnostics
  - Open Collector Flag Output
  - Two Output Voltage Monitoring Outputs (Analog)
- AEC−Q100 Grade 1 Qualified and PPAP Capable
- These Devices are Pb−Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Audio and Infotainment System
- Active Safety System



* V_{out_FB1} and V_{out_FB2} are sensed V_{out1} and V_{out2} output voltages, respectively, via internal resistor dividers

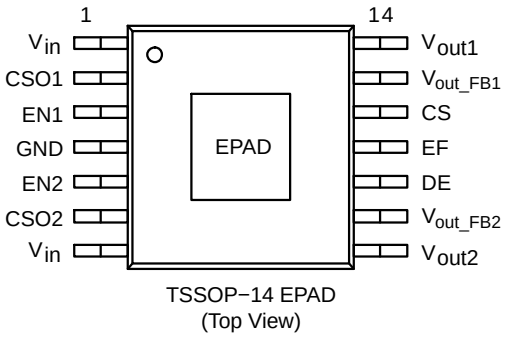

Figure 3. Pin Connections

Table 1. PIN FUNCTION DESCRIPTION

Pin No. TSSOP−14 EPAD	Pin Name	Description
1	V_{in}	Power Supply Input for Channel 1 and supply of control circuits of whole chip. At least 4.4 V power supply must be used for proper IC functionality.
2	CSO1	Current Sense Output 1, Current Limit setting and Output Current value information. See Application Section for more details.
3	EN1	Enable Input 1; low level disables the Channel 1. (Used also for OFF state diagnostics control for Channel 1)
4	GND	Power Supply Ground.
5	EN2	Enable Input 2; low level disables the Channel 2. (Used also for OFF state diagnostics control for Channel 2)
6	CSO2	Current Sense Output 2, Current Limit setting and Output Current value information. See Application Section for more details.
7	V_{in}	Power Supply Input for Channel 2. Connect to pin 1 or different power supply rail.
8	V_{out2}	Output Voltage 2.
9	V_{out_FB2}	Output Voltage 2 Analog Monitoring. See Application Section for more details.
10	DE	Diagnostic Enable Input.
11	EF	Error Flag (Open Collector) Output. Active Low.
12	CS	Channel Select Input for OFF state diagnostics. Set CS = Low for OFF state diagnostics of Channel 1. Set CS = High for OFF state diagnostics of Channel 2. Corresponding EN pin has to be used for diagnostics control (see Application Information section for more details).
13	V_{out_FB1}	Output Voltage 1 Analog Monitoring. See Application Section for more details.
14	V_{out1}	Output Voltage 1.
EPAD	EPAD	Exposed Pad is connected to Ground. Connect to GND plane on PCB.

Table 2. MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Input Voltage DC	V_{in}	−42	45	V
Input Voltage (Note 1) Load Dump − Suppressed	U_{s*}	−	60	V
Enable Input Voltage	$V_{EN1,2}$	−42	45	V
Output Voltage Monitoring	$V_{out\_FB1,2}$	−0.3	10	V
CSO Voltage	$V_{CSO1,2}$	−0.3	7	V
DE, CS and EF Voltages	V_{DE}, V_{CS}, V_{EF}	−0.3	7	V
Output Voltage	$V_{out1,2}$	−1	40	V
Junction Temperature	T_J	−40	150	°C
Storage Temperature	T_{STG}	−55	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Load Dump Test B (with centralized load dump suppression) according to ISO16750−2 standard. Guaranteed by design. Not tested in production. Passed Class A according to ISO16750−1.

Table 3. ESD CAPABILITY (Note 2)

Rating	Symbol	Min	Max	Unit
ESD Capability, Human Body Model	ESD_{HBM}	−2	2	kV

2. This device series incorporates ESD protection and is tested by the following methods:
   ESD Human Body Model tested per AEC−Q100−002 (JS−001−2010)
   Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes < 50 mm2 due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS−002−2014.

DEFINITIONS

General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

Input to Output Differential Voltage

The Input to Output Differential Voltage parameter is defined for specific output current values and specified over Temperature range.

Quiescent and Disable Currents

Quiescent Current (I_q) is the difference between the input current (measured through the LDO input pin) and the output load current. If Enable pin is set to LOW the regulator reduces its internal bias and shuts off the output, this term is called the disable current (I_{DIS}).

Current Limit

Current Limit is value of output current by which output voltage drops below 90% of its nominal value.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

Circuit Description

The NCV47822 is an integrated dual High Side Switch (HSS) with output current capability up to 250 mA per each output. It is enabled with an input to the enable pin. The integrated current sense feature provides diagnosis and system protection functionality. The current limit of the device is adjustable by resistor connected to CSO pin. Voltage on CSO pin is proportional to output current. The HSS is protected by both current limit and thermal shutdown. Thermal shutdown occurs above 150°C to protect the IC during overloads and extreme ambient temperatures.

Enable Inputs

An enable pin is used to turn a channel on or off. By holding the pin down to a voltage less than 0.99 V, the output of the channel will be turned off. When the voltage on the enable pin is greater than 2.31 V, the output of the channel will be enabled to power its output to the regulated output voltage. The enable pins may be connected directly to the input pin to give constant enable to the output channel.

Setting the Output Current Limit

The output current limit can be set up to 350 mA by external resistor $R_{CSO1,2}$ (see Figure 1). Capacitor C_{CSO} of 1 μF in parallel with R_{CSO} is required for stability of current limit control circuitry (see Figure 1).

$$V_{CSO1,2} = I_{out1,2}\left(R_{CSO1,2} \times \frac{1}{RATIO}\right) \quad \text{(eq. 1)}$$

$$I_{LIM1,2} = \frac{RATIO}{1} \times \frac{2.55}{R_{CSO1,2}} \quad \text{(eq. 2)}$$

$$R_{CSO1,2} = \frac{RATIO}{1} \times \frac{2.55}{I_{LIM1,2}} \quad \text{(eq. 3)}$$

where

$R_{CSO1,2}$ − current limit setting resistor

$V_{CSO1,2}$ - voltage at CSO pin proportional to $I_{out1,2}$

$I_{LIM1,2}$ − current limit value

$I_{out1,2}$ − output current actual value

RATIO − typical value of Output Current to CSO Current Ratio for particular output current range

CSO pin provides information about output current actual value. The CSO voltage is proportional to output current according to Equation 1.

Once output current reaches its limit value ($I_{LIM1,2}$) set by external resistor R_{CSO} than voltage at CSO pin is typically 2.55 V. Calculations of $I_{LIM1,2}$ or $R_{CSO1,2}$ values can be done using equations Equation 2 and Equation 3, respectively. Minimum and maximum value of Output Current Limit can be calculated according Equation 4 and 5.

$$I_{LIM1,2\_min} = RATIO_{min} \times \frac{V_{CSO1,2\_min}}{R_{CSO1,2\_max}} \quad \text{(eq. 4)}$$

$$I_{LIM1,2\_max} = RATIO_{max} \times \frac{V_{CSO1,2\_max}}{R_{CSO1,2\_min}} \quad \text{(eq. 5)}$$

where

$RATIO_{min}$ − minimum value of Output Current to CSO Current Ratio from electrical characteristics table and particular output current range

$RATIO_{max}$ − maximum value of Output Current to CSO Current Ratio from electrical characteristics table and particular output current range

$V_{CSO1,2\_min}$ - minimum value of CSO Voltage Level at Current Limit from electrical characteristics table

$V_{CSO1,2\_max}$ - maximum value of CSO Voltage Level at Current Limit from electrical characteristics table

$R_{CSO1,2\_min}$ − minimum value of $R_{CSO1,2}$ with respect its accuracy

$R_{CSO1,2\_max}$ − maximum value of $R_{CSO1,2}$ with respect its accuracy

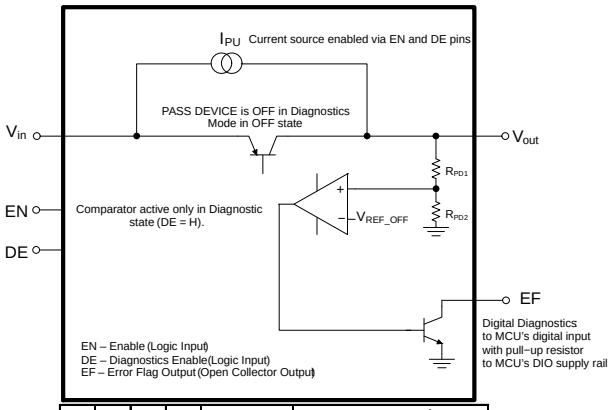
Designers should consider the tolerance of $R_{CSO1,2}$ during the design phase.

Diagnostic in OFF State

The NCV47822 contains also circuitry for OFF state diagnostics for Short to Battery (STB) and Open Load (OL). There are internal current sources and Pull Down resistors which provide additional cost savings for overall application

by excluding external components and their assembly cost and saving PCB space and safe control IOs of a Microcontroller Unit (MCU).

Simplified functional schematic and truth table is shown in Figure 13 and related flowchart in Figure 14.



EN	DE	I_{PU}	EF	V_{out}	Diagnostic Status/Action
L	L	OFF	HZ	Unknown	None (Diagnostics OFF)
L	H	OFF	L	$V_{out} > V_{out\_OFF}$	Short to Battery (STB)
L	H	OFF	HZ	$V_{out} < V_{out\_OFF}$	Check for Open Load (OL)
H	H	ON	L	$V_{out} > V_{out\_OFF}$	Open Load (OL)
H	H	ON	HZ	$V_{out} < V_{out\_OFF}$	No Failure (V_{out} close to 0 V)

Figure 13. Simplified Functional Diagram of OFF State Diagnostics (STB and OL)

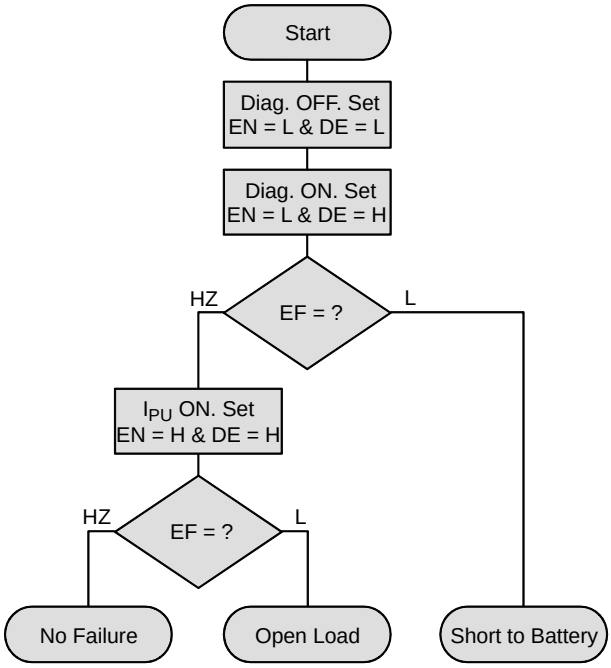


Figure 14. Flowchart for Diagnostics in OFF State

The diagnostics in OFF state shall be performed for each channel separately. For diagnostics of Channel 1 the input CS pin has to be put logic low, for diagnostics of Channel 2 the input CS pin has to be put logic high. Corresponding EN pin has to be used for control (EN1 for Channel 1 and EN2 for Channel 2).

Diagnostic in ON State

Diagnostic in ON State provides information about Overcurrent or Short to Ground failures, during which the EF output is in logic low state. The diagnostics in ON state shall be performed for each channel separately. For diagnostics of Channel 1 the input CS pin has to be put logic low, for diagnostics of Channel 2 the input CS pin has to be put logic high. For detailed information see Diagnostic Features Truth Table in Figure 15.

Output Voltage Monitoring

The Output Voltage net is connected to internal resistor divider. Output of the resistor divider is connected to $V_{out\_FB1,2}$ pin and provides information about Output Voltage Level according to Equation 4.

$$V_{out\_FB1,2} = \frac{V_{out1,2}}{6} \quad \text{(eq. 6)}$$

Operational Status	EN [10]	DE	CS	Output Voltage (V_{out1} or V_{out2})	Diagnostic Output (CSO1 or CSO2)	Error Flag (EF)
Disabled	L	L	X	Low (~0 V)	Low (~0 V)	HZ
Short to Battery	L	H	L/H [11]	High (V_{out} ~ V_{in})	Low (~0 V)	L [12]
Open Load (OFF)	H	H	L/H [11]	High (V_{out} ~ V_{in})	Low (~0 V)	L [13]
Normal (OFF)	H	H	L/H [11]	Low (~0 V)	Low (~0 V)	HZ [13]
Open Load (ON)	H	L	X	V_{out_nom}	Low (~0 V)	HZ
Normal (ON)	H	L	X	V_{out_nom}	Proportional to I_{out} (±10 %)	HZ
Over Current	H	L	L/H [14]	V_{out_nom} – 1 V	High (~2.55 V)	L
Short to Ground	H	L	L/H [14]	Low (~0 V)	High (~2.55 V)	L

Figure 15. Diagnostic Features Truth Table

10. State of EN pin of appropriate channel
11. CS = L means CH1 diagnostics and CS = H means CH2 diagnostics in OFF state (DE = H) via EF output, appropriate EN pin is used for turning internal switch ON and OFF (e.g. when DE = H and CS = L and EN1 = L then IPU1 is OFF, when DE = H and CS = L and EN1 = H then IPU1 is ON)
12. Internal current source turned OFF (between V_{out} and V_{in} of appropriate channel)
13. Internal current source turned ON (between V_{out} and V_{in} of appropriate channel)
14. CS = L means CH1 diagnostics and CS = H means CH2 diagnostics in ON state (e.g. when CS = L and EF = L then CH1 has Overcurrent or Short to Ground failure, when CS = H and EF = L then CH1 has Overcurrent or Short to Ground failure)

Thermal Considerations

As power in the device increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the device has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the device can handle is given by:

$$P_{D(MAX)} = \frac{\left[T_{J(MAX)} - T_A\right]}{R_{\theta JA}} \quad \text{(eq. 7)}$$

Since T_J is not recommended to exceed 150°C, then the device soldered on 645 mm^2, 1 oz copper area, FR4 can dissipate up to 2.38 W when the ambient temperature (T_A) is 25°C. See Figure 16 for $R_{\theta JA}$ versus PCB area. The power dissipated by the device can be calculated from the following equations:

$$P_D \approx V_{in}\left(I_q @ I_{out1,2}\right) + I_{out1}\left(V_{in} - V_{out1}\right) + I_{out2}\left(V_{in} - V_{out2}\right) \quad \text{(eq. 8)}$$

or

$$V_{in(MAX)} \approx \frac{P_{D(MAX)} + \left(V_{out1} \times I_{out1}\right) + \left(V_{out2} \times I_{out2}\right)}{I_{out1} + I_{out2} + I_q} \quad \text{(eq. 9)}$$

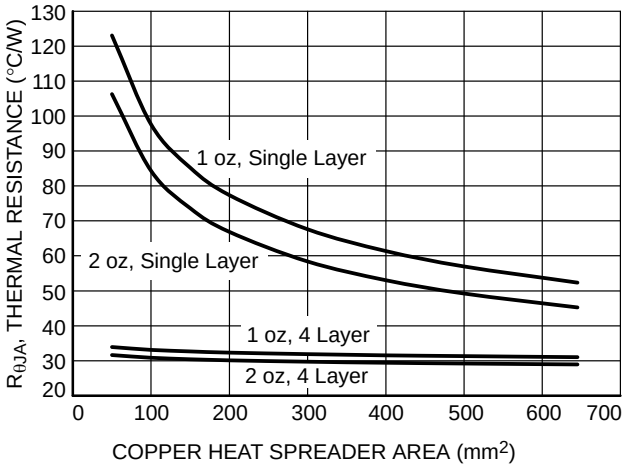

Figure 16. Thermal Resistance vs. PCB Copper Area

Hints

V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the device and make traces as short as possible.

The Output Voltage Monitoring Output is high impedance output (see Figure 2) and during OFF state diagnostics it may be prone to couple a noise via PCB track or wire. Disturbing may appear as Error Flag Output oscillation when Output Voltage Level is close to Short to Battery threshold. To improve robustness connect capacitor (typically 10 nF) between each $V_{out_FB1,2}$pin and GND as close as possible to the $V_{out\_FB1,2}$ pins.
