

NUF2221W1T2

USB Upstream Terminator with ESD Protection

This device is designed for applications requiring **Line Termination**, **EMI Filtering** and **ESD Protection**. It is intended for use in upstream USB ports, Cellular phones, Wireless equipment and computer applications. This device offers an integrated solution in a small package (SC-88/SOT-363) reducing PCB space and cost.

Features

- Provides USB Line Termination, Filtering and ESD Protection
- Single IC Offers Cost Savings
- Bi-directional EMI Filtering Prevents Noise from Entering/Leaving the System
- Compliance with IEC61000-4-2 (Level 4)
8 kV (Contact)
15 kV (Air)
- Flexible Pull-up Line Termination to Meet USB 1.1 Low Speed and High Speed Specification
- ESD Ratings: Machine Model = C
Human Body Model = 3B
- Pb-Free Package is Available

Benefits

- SC-88 Package Minimizes PCB Space
- Integrated Circuit Increases System Reliability versus Discrete Component Implementation
- TVs Devices Provide ESD Protection That is Better than a Discrete Implementation because the Small IC minimizes Parasitic Inductances

Typical Applications

- USB Hubs
- Computer Peripherals Using USB

MAXIMUM RATINGS ($T_A = 25^\circ\text{C}$)

| Rating | Symbol | Value | Unit |
|---|--------------|-------------|------------------|
| Steady State Power | P_D | 225 | mW |
| Maximum Junction Temperature | $T_{J(max)}$ | 125 | $^\circ\text{C}$ |
| Operating Temperature Range | T_J | -55 to +125 | $^\circ\text{C}$ |
| Storage Temperature Range | T_{stg} | -55 to +125 | $^\circ\text{C}$ |
| Lead Solder Temperature (10 second duration) | T_L | 260 | $^\circ\text{C}$ |

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

APPLICATIONS BACKGROUND

What is USB?

The USB is not a serial port, it is a serial bus, a fact that enables a single port on the computer to be a link for a myriad of devices, (up to 127 devices in a USB system). We can easily chain one device to another and use one port as a connecting point of many devices by using a hub. All these enable us to look at the USB system as a small network of devices.

The Universal Serial Bus (USB) makes connecting devices to your computer faster, easier and virtually limitless. High-Speed USB devices are capable of communicating at speeds up to 12 megabytes—without shutting down and without having to open your computer.

Typical USB System

Figure 4. Typical USB System

Typically the USB system consists of one host, hubs and devices.

The Host

The host in the USB system, is responsible to the whole complexity of the protocol (simplifies the designing of USB devices). The host controls the media access, therefore, no one can access the bus unless it got an approval required from the host.

The Hub

The hub provides an interconnect point, which enables many devices to connect to a single USB port. The logical topology of the USB is a star structure, all the devices are connected (logically) directly to the host. It is totally transparent to the device what is its' hub tier (the number of hubs the data has to flow through). The hub is connected to the USB host in the upstream direction (data flows "up" to the host) and is connected to the USB device in the downstream direction (data flows "down" from the host to the device). The hubs' main functionality is the responsibility of detecting an attachment and detachment of

devices, handling the power management for devices that are bus-powered (get power from the bus), and responsibility for bus error detection and recovery. Another important role of the hub is to manage both full and low speed devices. When a device is attached to the system the hub detects the speed, which the device operates in, and through the whole communication on the bus prevents from full speed traffic to reach low speed device and vice versa – prevent from low speed traffic to reach full speed device.

The Device

The Device is defined as everything in the USB system, which is not a host (including hubs). A device provides one or more USB functions. Most of the devices provide only one function but there may be some, which provides more than one and called compound devices. We refer to two kinds of devices – self powered or bus powered devices. A device that gets its power from the bus is called bus powered and on the other hand a device which supplies its own power is called self powered. There are two kinds of devices for USB 1.1:

Full-speed devices – operates in 12 Mb/s

Low-speed devices that work in 1.5 Mb/s.

NUF2221W1T2 Device Information

The Universal Serial Bus (USB) specification revision 1.1 requires the USB drivers to have certain impedance characteristics. The series resistance plus the USB driver output resistance must be close to the USB cable's impedance of 45 Ω unbalanced (90 Ω balance) to minimize transmission line reflections. In addition USB 1.1 also requires upstream ports to be terminated with a pull-up resistor (usually 1.5 K Ω) from D+ or D– lines to $V_{CC}=3.3$ V (V_{CC} is usually taken from V_{BUS} by using a 5 V – 3.3 V regulator). In case of EMI, the radiated and conducted EMI should be kept within the required levels as specified by the FCC regulations. Actual FCC regulations requires that class B computing devices meet the specifications of maximum levels for both radiated and conducted EMI (Radiated EMI covers the frequency range from 30 MHz to 1 GHz and Conducted EMI covers the 450 kHz to 30MHz range).

The NUF2221W1T2 device from On Semiconductor provides series termination, EMI filtering and ESD protection for the two data lines (D+, D–) as well as for the VBUS. The ESD device's ratings comply with IEC61000-4-2 (Level 4), HBM class 3B and MM class C. All these features are offered in an integrated solution placed

NUF2221W1T2

in a small and single package (SC-88, Case 419B). The NUF2221W1T2 device is shown in the Figure 5.

Figure 5. Device Description

Connection for Full-Speed and Low-Speed Devices

The USB 1.1 specification calls for two data rates:

- Full-speed devices – operates in 12 Mb/s
- Low-speed devices that work in 1.5 Mb/s.

The NUF2221W1T2 device can be shaped for either full-speed or low-speed by connecting one of the data lines (D+, D-) to a 3.3 V voltage supply through the 1.5 KΩ pull up resistor. The device's connection diagrams for each speed are described as follows:

Full-Speed Connection

The Pull up resistor (R_{UP}) is connected to the D+ Line. The terminal 5 is connected to a 3.3 V voltage supply while the terminal 2 is connected to ground. The input of the D+ line is connected in the terminal 1 which outputs from the

terminal 6. Finally, the input of the D- line is connected in the terminal 3 which outputs from the terminal 4. Figure 6 shows the connections of the NUF2221W1T2 device for "Full-Speed".

Figure 6. Full Speed Connection

Low-Speed Connection

The Pull up resistor (R_{pu}) is connected to the D- Line. The terminal 5 is connected to a 3.3 V voltage supply while the terminal 2 is connected to ground. The input of the D- line is connected in the terminal 1 which outputs from the terminal 6. Finally, the input of the D+ line is connected in the terminal 3 which outputs from the terminal 4. The Figure 7 shows the connections of the NUF2221W1T2 device for "Low-Speed".
