

STV9302A

Vertical Deflection Booster for 2-A_{PP}TV/Monitor Applications with 70-V Flyback Generator

Main Features

- Power Amplifier
- Flyback Generator
- Output Current up to 2 App
- Thermal Protection
- Stand-by Control

Description

The STV9302A is a vertical deflection booster designed for TV and monitor applications.

This device, supplied with up to 35 V, provides up to 2 App output current to drive the vertical deflection yoke.

The internal flyback generator delivers flyback voltages up to 70 V.

in double-supply applications, a stand-by state will be reached by stopping the (+) supply alone.

1 Absolute Maximum Ratings

Symbol	Parameter	Value	Unit
Voltage			
V _S	Supply Voltage (pin 2) - Note 1 and Note 2	40	V
V ₅ , V ₆	Flyback Peak Voltage - Note 2	70	V
V ₃	Voltage at Pin 3 - Note 2, Note 3 and Note 6	-0.4 to (V _S + 3)	V
V ₁ , V ₇	Amplifier Input Voltage - Note 2, Note 6 and Note 7	- 0.4 to (V _S + 2) or +40	V
Current			
I ₀ (1)	Output Peak Current at f = 50 to 200 Hz, t \leq 10µs - Note 4	±5	А
I ₀ (2)	Output Peak Current non-repetitive - Note 5	±2	А
I ₃ Sink	Sink Current, t<1ms - Note 3	1.5	А
I ₃ Source	Source Current, t < 1ms	1.5	А
l ₃	Flyback pulse current at f=50 to 200 Hz, t≤10µs - Note 4	±5	А
ESD Susceptibili	ity		
ESD1	Human body model (100 pF discharged through 1.5 k Ω)	2	kV
ESD2	EIAJ Standard (200 pF discharged through 0 Ω)	300	V
Temperature			
Τ _s	Storage Temperature	-40 to 150	°C
Тj	Junction Temperature	+150	°C

Note:1. Usually the flyback voltage is slightly more than $2 \times V_S$. This must be taken into consideration when setting V_S .

- 2. Versus pin 4
- 3. V3 is higher than V_S during the first half of the flyback pulse.
- 4. Such repetitive output peak currents are usually observed just before and after the flyback pulse.
- 5. This non-repetitive output peak current can be observed, for example, during the Switch-On/Switch-Off phases. This peak current is acceptable providing the SOA is respected (Figure 8 and Figure 9).
- 6. All pins have a reverse diode towards pin 4, these diodes should never be forward-biased.
- 7. Input voltages must not exceed the lower value of either V_S + 2 or 40 volts.

2 Thermal Data

Symbol	Parameter	Value	Unit
R _{thJC}	Junction-to-Case Thermal Resistance	3	°C/W
T _T	Temperature for Thermal Shutdown	150	°C
TJ	Recommended Max. Junction Temperature	120	°C

3 Electrical Characteristics

(V_S = 32 V, T_{AMB} = 25°C, unless otherwise specified)

Symbol	Parameter	Test Conditions	Min.	Тур.	Max.	Unit	Fig.
Supply				Į			
VS	Operating Supply Voltage Range (V ₂ -V ₄)	Note 8	10		35	V	
I ₂	Pin 2 Quiescent Current	$I_3 = 0, I_5 = 0$		5	20	mA	1
I ₆	Pin 6 Quiescent Current	$I_3 = 0, I_5 = 0, V_6 = 35v$	8	19	50	mA	1
Input				1			
I ₁	Input Bias Current	$V_1 = 1 V, V_7 = 2.2 V$		- 0.6	-1.5	μA	1
I ₇	Input Bias Current	V ₁ = 2.2 V, V ₇ = 1 V		- 0.6	-1.5	μA	
V _{IR}	Operating Input Voltage Range		0		V _S - 2	V	
V _{I0}	Offset Voltage			2		mV	
$\Delta V_{10}/dt$	Offset Drift versus Temperature			10		μV/°C	
Output							
Ι _Ο	Operating Peak Output Current				±1	А	
V _{5L}	Output Saturation Voltage to pin 4	I ₅ = 1 A		1	1.7	V	3
V _{5H}	Output Saturation Voltage to pin 6	I ₅ = -1 A		1.8	2.3	V	2
Stand-by				I			
V _{5STBY}	Output Voltage in Stand-by	$V_1 = V_7 = V_S = 0$ See Note 9	V _S - 2			V	
Miscellan	eous			1			
G	Voltage Gain		80			dB	
V _{D5-6}	Diode Forward Voltage Between pins 5-6	I ₅ = 1 A		1.4	2	V	
V _{D3-2}	Diode Forward Voltage between pins 3-2	I ₃ = 1 A		1.3	2	V	
V _{3SL}	Saturation Voltage on pin 3	I ₃ = 20 mA		0.4	1	V	3
V _{3SH}	Saturation Voltage to pin 2 (2nd part of flyback)	I ₃ = -1 A		2.1		V	

- 8. In normal applications, the peak flyback voltage is slightly greater than $2 \times (V_S V_4)$. Therefore, $(V_S V_4) = 35 \text{ V}$ is not allowed without special circuitry.
- 9. Refer to Figure 4, Stand-by condition.

Figure 3: Measurement of V_{3L} and V_{5L}

4 Application Hints

The yoke can be coupled either in AC or DC.

4.1 DC-coupled Application

When DC coupled (see Figure 4), the display vertical position can be adjusted with input bias. On the other hand, 2 supply sources (V_S and $-V_{EE}$) are required.

A Stand-by state will be reached by switching OFF the positive supply alone. In this state, where both inputs are the same voltage as pin 2 or higher, the output will sink negligible current from the deviation coil.

4.1.1 Application Hints

For calculations, treat the IC as an op-amp, where the feedback loop maintains $V_1 = V_7$.

5/

4.1.1.1 Centering

Display will be centered (null mean current in yoke) when voltage on pin 7 is (R1 is negligible):

$$V_7 = \frac{V_M + V_m}{2} \times \left\{ \frac{R_2}{R_2 + R_3} \right\}$$

4.1.1.2 Peak Current

$$I_{\mathsf{P}} = \frac{(\mathsf{V}_{\mathsf{M}} - \mathsf{V}_{\mathsf{m}})}{2} \times \frac{\mathsf{R}_2}{\mathsf{R}_1 \mathsf{x} \mathsf{R}_3}$$

Example: for $V_m = 2 V$, $V_M = 5 V$ and $I_P = 1 A$

Choose R₁ in the1 Ω range, for instance R₁=1 Ω

From equation of peak current: $\frac{R_2}{R_3} = \frac{2 \times I_P \times R_1}{V_M - V_m} = \frac{2}{3}$

Then choose R_2 or R_3 . For instance, if R_2 = 10 k Ω , then R_3 = 15 k Ω

Finally, the bias voltage on pin 7 should be:

$$V_7 = \frac{V_M + V_m}{2} \times \frac{1}{1 + \frac{R_3}{R_2}} = \frac{7}{2} \times \frac{1}{2.5} = 1.4V$$

4.1.2 Ripple Rejection

When both ramp signal and bias are provided by the same driver IC, you can gain natural rejection of any ripple caused by a voltage drop in the ground (see Figure 5), if you manage to apply the same fraction of ripple voltage to both booster inputs. For that purpose, arrange an intermediate point in the bias resistor bridge, such that $(R_8 / R_7) = (R_3 / R_2)$, and connect the bias filtering capacitor between the intermediate point and the local driver ground. Of course, R_7 should be connected to the booster reference point, which is the ground side of R_1 .

4.2 AC-Coupled Applications

In AC-coupled applications (See Figure 6), only one supply (V_S) is needed. The vertical position of the scanning cannot be adjusted with input bias (for that purpose, usually some current is injected or sunk with a resistor in the low side of the yoke).

Figure 6: AC-coupled Application

4.2.1 Application Hints

Gain is defined as in the previous case:

$$I_{p} = \frac{V_{M} - V_{m}}{2} \times \frac{R_{2}}{R_{1} \times R_{3}}$$

Choose R_1 then either R_2 or R_3 . For good output centering, V_7 must fulfill the following equation:

$$\frac{V_{S}}{\frac{2}{R_{4}} - V_{7}}{R_{4} + R_{5}} = \frac{V_{7} - \frac{V_{M} + V_{m}}{2}}{R_{3}} + \frac{V_{7}}{R_{2}}$$

or

$$V_7 \times \left(\frac{1}{R_3} + \frac{1}{R_2} + \frac{1}{R_4 + R_5}\right) = \left(\frac{V_S}{2(R_4 + R_5)} + \frac{V_M + V_m}{2 \times R_3}\right)$$

57

 C_S performs an integration of the parabolic signal on C_L , therefore the amount of S correction is set by the combination of C_L and C_s .

4.3 Application with Differential-output Drivers

Certain driver ICs provide the ramp signal in differential form, as two current sources i_{+} and i_{-} with opposite variations.

Figure 7: Using a Differential-output Driver

Let us set some definitions:

- i_{cm} is the common-mode current: $i_{cm} = \frac{1}{2}(i_{+} + i_{-})$
- at peak of signal, $i_{+} = i_{cm} + i_{p}$ and $i_{-} = i_{cm} i_{p}$, therefore the peak differential signal is $i_{p} (-i_{p}) = 2 i_{p}$, and the peak-peak differential signal, $4i_{p}$.

The application is described in Figure 7 with DC yoke coupling. The calculations still rely on the fact that V_1 remains equal to V_7 .

4.3.1 Centring

When idle, both driver outputs provide i_{cm} and the yoke current should be null (R₁ is negligible), hence:

 $i_{cm} \cdot R_7 = i_{cm} \cdot R_2$ therefore $R_7 = R_2$

4.3.2 Peak Current

Scanning current should be IP when positive and negative driver outputs provide respectively

 i_{cm} - i_{p} and i_{cm} + i_{p} , therefore

 $(i_{cm}-i) \cdot R_7 = I_p \cdot R_1 + (i_{cm}+i) \cdot R_2$ and since $R_7 = R_2$: $\frac{I_p}{i} = -\frac{2R_7}{R_1}$

Choose R_1 in the 1 Ω range, the value of $R_2 = R_7$ follows. Remember that i is one-quarter of driver peak-peak differential signal! Also check that the voltages on the driver outputs remain inside allowed range.

Example: for i_{cm} = 0.4mA, i = 0.2mA (corresponding to 0.8mA of peak-peak differential current), I_p = 1A

Choose $R_1 = 0.75\Omega$, it follows $R_2 = R_7 = 1.875k\Omega$.

4.3.3 Ripple Rejection

Make sure to connect R7 directly to the ground side of R1.

4.3.4 Secondary Breakdown Diagrams

Figure 8: Output Transistor Safe Operating Area (SOA) for Secondary Breakdown

The diagram has been arbitrarily limited to max VS (35 V) and max I0 (2 A).

5 Mounting Instructions

The power dissipated in the circuit is removed by adding an external heatsink. With the HEPTAWATT[™] package, the heatsink is simply attached with a screw or a compression spring (clip).

A layer of silicon grease inserted between heatsink and package optimizes thermal contact. In DCcoupled applications we recommend to use a silicone tape between the device tab and the heatsink to electrically isolate the tab.
