TAS5782M

SLASEG8-MARCH 2017

TAS5782M 30 W Stereo Class-D Amplifier with 96-kHz Processing

Features 1

- Flexible Audio I/O Configuration
 - Supports I²S, TDM, LJ, RJ Digital Input
 - Sample Rate Support
 - BD Amplifier Modulation
 - Supports 3-Wire Digital Audio Interface (No MCLK required)
- High-Performance Closed-Loop Architecture (PVDD = 12 V, R_{SPK} = 8 Ω , SPK_GAIN = 20 dB)
 - Closed-Loop = reduced component count/ smaller solution size
 - Idle Channel Noise = $62 \mu Vrms$ (A-Wtd)
 - THD+N = 0.2% (at 1 W, 1 kHz)
 - SNR = 103dB A-Wtd (Ref. to THD+N = 1%)
- Flexible Processing Features
 - 15 BiQuads / SmartEQ
 - 2 x 5 BiQuads for X-Over / EQ
 - 3-Band Advanced DRC + AGL
 - Dynamic EQ and SmartBass
 - Sound Field Spatializer (SFS)
 - 96-kHz Processor Sampling
- **Communication Features**
 - Software Mode Control via I²C Port
 - Two Address Select Pins Up to 4 Devices
- **Robustness and Reliability Features**
 - Clock Error, DC, and Short-Circuit Protection
 - Overtemperature and Overcurrent Protection

Simplified Block Diagram

2 Applications

- LCD, LED TV, and Multi-Purpose Monitors
- Sound Bars, Docking Stations, and PC Audio
- Wireless Subwoofers, Bluetooth Speakers, and **Active Speakers**

3 Description

The TAS5782M device is a high-performance, stereo closed-loop Class-D amplifier with integrated audio processor with up to 96-kHz architecture. To convert from digital to analog, the device uses a high performance DAC with Burr Brown™ audio technology. It requires only two power supplies: one DVDD for low-voltage circuitry and one PVDD for high-voltage circuitry. It is controlled by a software control port using standard I²C communication.

An optimal mix of thermal performance and device cost is provided in the 90 m Ω $r_{\text{DS(on)}}$ of the output MOSFETs. Additionally, a thermally enhanced 48-Pin TSSOP provides excellent operation in the elevated ambient temperatures found in modern consumer electronic devices.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) | | |
|-------------|------------|--------------------|--|--|
| TAS5782M | TSSOP (48) | 12.50 mm × 6.10 mm | | |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Power at 10% THD+N vs PVDD (1)

(1) Tested on TAS5782MEVM Board.

7 Specifications

7.1 Absolute Maximum Ratings

Free-air room temperature 25°C (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|---------------------------|--|------|------------------|------|
| DVDD, AVDD, CPVDD | Low-voltage digital, analog, charge pump supply | -0.3 | 3.9 | V |
| PVDD | PVDD supply | -0.3 | 30 | V |
| V _{I(AmpCtrl)} | Input voltage for SPK_GAIN/FREQ and SPK_FAULT pins | -0.3 | $V_{GVDD} + 0.3$ | V |
| V _{I(DigIn)} | DVDD referenced digital inputs ⁽²⁾ | -0.5 | V_{DVDD} + 0.5 | V |
| V _{I(SPK_INxx)} | Analog input into speaker amplifier | -0.3 | 6.3 | V |
| V _{I(SPK_OUTxx)} | Voltage at speaker output pins | -0.3 | 32 | V |
| | Ambient operating temperature, T _A | -25 | 85 | °C |
| - | Operating junction temperature, digital die | -40 | 125 | °C |
| TJ | Operating junction temperature, power die | -40 | 165 | °C |
| T _{stg} | Storage temperature | -40 | 125 | °C |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) <u>DVDD referenced digital pins include: ADR0, ADR1, GPIO0, GPIO2, LRCK/FS, MCLK, RESET, SCL, SCLK, SDA, SDIN, and SPK_MUTE.</u>

7.2 ESD Ratings

| | | | VALUE | UNIT |
|--------------------|---------------|--|-------|------|
| V | Electrostatic | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 | M |
| V _(ESD) | discharge | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±500 | V |

(1) JEDEC document JEP155 states that 2000-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 500-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Free-air room temperature 25°C (unless otherwise noted)

| | | | MIN | NOM | MAX | UNIT | |
|------------------------|---|---------------------------------|-----------------------|-----|-----------------------|------|--|
| V _(POWER) | Dower eucely inpute | DVDD, AVDD, CPVDD | 2.9 | | 3.63 | N/ | |
| | Power supply inputs | PVDD | 4.5 | | 26.4 | V | |
| D | Minimum anackar lood | BTL Mode | 3 | | | Ω | |
| R _{SPK} | Minimum speaker load | PBTL Mode | 2 | | | Ω | |
| V _{IH(DigIn)} | Input logic high for DVDD referenced digital inputs ⁽¹⁾⁽²⁾ | | $0.9 \times V_{DVDD}$ | | V _{DVDD} | V | |
| V _{IL(DigIn)} | Input logic low for DVDD referenced digital inputs ⁽¹⁾⁽³⁾ | | V _{DVDD} | 0 | $0.1 \times V_{DVDD}$ | V | |
| L _{OUT} | Minimum inductor value i condition | n LC filter under short-circuit | 1 | 4.7 | | μH | |

(1) DVDD referenced digital pins include: ADR0, ADR1, GPIO0, GPIO2, LRCK/FS, MCLK, RESET, SCL, SCLK, SDA, SDIN, and SPK_MUTE.

(2) The best practice for driving the input pins of the TAS5782M device is to power the drive circuit or pullup resistor from the same supply which provides the DVDD power supply.

(3) The best practice for driving the input pins of the TAS5782M device low is to pull them down, either actively or through pulldown resistors to the system ground.

7.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | | | | |
|-------------------------------|--|----------------------------------|----------------------------------|----------------------------|------|
| | | JEDEC STANDARD 2-LAYER PCB | JEDEC STANDARD 4-LAYER PCB | TAS5782MEVM 4-LAYER PCB | UNIT |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 41.8 | 27.6 | 19.4 | °C/W |
| R _{0JC(top)} | Junction-to-case (top) thermal resistance | 14.4 | 14.4 | 14.4 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 9.4 | 9.4 | 9.4 | °C/W |
| ΨJT | Junction-to-top characterization parameter | 0.6 | 0.6 | 2 | °C/W |
| Ψјв | Junction-to-board characterization parameter | 8.1 | 9.3 | 4.8 | °C/W |
| R _{0JC(bot)} | Junction-to-case (bottom) thermal resistance | N/A | N/A | N/A | °C/W |

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

7.5 Electrical Characteristics

Free-air room temperature 25°C (unless otherwise noted) Measurements were made using TAS5782MEVM board and Audio Precision System 2722 with Analog Analyzer filter set to 40 kHz brickwall filter. The device output PWM frequency was set to 768 kHz unless otherwise noted.

| | PARAMETER | TEST CONDITIONS | MIN | TYP MAX | UNIT |
|----------------------------|--|--|---------------------|---------|-------------------------------|
| DIGITAL I/O | | | | | • |
| IIH 1 | Input logic high current level for DVDD referenced digital input pins ⁽¹⁾ | V _{IN(DigIn)} = V _{DVDD} | | 10 | μA |
| IIL 1 | Input logic low current level for DVDD referenced digital input pins ⁽¹⁾ | V _{IN(DigIn)} = 0 V | | -10 | μA |
| V _{IH1} | Input logic high threshold for DVDD referenced digital inputs ⁽¹⁾ | | 70% | | V _{DVDD} |
| V _{IL1} | Input logic low threshold for DVDD referenced digital inputs ⁽¹⁾ | | | 30% | V _{DVDD} |
| V _{OH(DigOut)} | Output logic high voltage level ⁽¹⁾ | I _{OH} = 4 mA | 80% | | V _{DVDD} |
| V _{OL(DigOut)} | Output logic low voltage level ⁽¹⁾ | I _{OH} = -4 mA | | 22% | V _{DVDD} |
| V _{OL(SPK_FAULT)} | Output logic low voltage level for SPK_FAULT | With 100-k Ω pullup resistor | | 0.8 | V |
| GVDD_REG | GVDD regulator voltage | | | 7 | V |
| I ² C CONTROL F | PORT | | | | |
| C _{L(I2C)} | Allowable load capacitance for each I ² C Line | | | 400 | pF |
| f _{SCL(fast)} | Support SCL frequency | No wait states, fast mode | | 400 | kHz |
| f _{SCL(slow)} | Support SCL frequency | No wait states, slow mode | | 100 | kHz |
| V _{NH} | Noise margin at High level for each connected device (including hysteresis) | | $0.2 \times V_{DD}$ | | V |
| MCLK AND PLL | SPECIFICATIONS | | | | |
| D _{MCLK} | Allowable MCLK duty cycle | | 40% | 60% | |
| f _{MCLK} | Supported MCLK frequencies | Up to 50 MHz | 128 | 512 | f _S ⁽²⁾ |
| f | PLL input frequency | Clock divider uses fractional divide $D > 0, P = 1$ | 6.7 | 20 | MHz |
| f _{PLL} | | Clock divider uses integer divide $D = 0, P = 1$ | 1 | 20 | |
| SERIAL AUDIO | PORT | | | | |
| t _{DLY} | Required LRCK/FS to SCLK rising edge delay | | 5 | | ns |
| D _{SCLK} | Allowable SCLK duty cycle | | 40% | 60% | |
| f _S | Supported input sample rates | | 8 | 96 | kHz |
| f _{SCLK} | Supported SCLK frequencies | | 32 | 64 | f _S ⁽²⁾ |
| f _{SCLK} | SCLK frequency | Either master mode or slave mode | | 24.576 | MHz |
| SPEAKER AMP | LIFIER (ALL OUTPUT CONFIGUE | RATIONS) | | | |
| ٨ | Speaker amplifier gain | SPK_GAIN/FREQ voltage < 3 V, see Adjustable Amplifier Gain and Switching Frequency Selection | | 20 | dBV |
| A _{V(SPK_AMP)} | opeaner ampliller galli | SPK_GAIN/FREQ voltage > 3.3 V, see Adjustable Amplifier Gain and Switching Frequency Selection | | 26 | UDV |
| $\Delta A_{V(SPK_AMP)}$ | Typical variation of speaker amplifier gain | | | ±1 | dBV |

(1) DVDD referenced digital pins include: ADR0, ADR1, GPIO0, GPIO2, LRCK/FS, MCLK, RESET, SCL, SCLK, SDA, SDIN, and SPK_MUTE.

(2) A unit of f_S indicates that the specification is the value listed in the table multiplied by the sample rate of the audio used in the TAS5782M device.

Electrical Characteristics (continued)

Free-air room temperature 25°C (unless otherwise noted) Measurements were made using TAS5782MEVM board and Audio Precision System 2722 with Analog Analyzer filter set to 40 kHz brickwall filter. The device output PWM frequency was set to 768 kHz unless otherwise noted.

| | PARAMETER | TEST CONDITIONS | MIN TY | P MAX | UNIT |
|----------------------------|--|---|--------|-------|-------------------|
| f _{spk_amp} | Switching frequency of the speaker amplifier | Switching frequency depends on voltage presented at SPK_GAIN/FREQ pin and the clocking arrangement, including the incoming sample rate, see <i>Adjustable Amplifier Gain and</i> <i>Switching Frequency Selection</i> | 176.4 | 768 | kHz |

ISTRUMENTS

EXAS

Electrical Characteristics (continued)

Free-air room temperature 25°C (unless otherwise noted) Measurements were made using TAS5782MEVM board and Audio Precision System 2722 with Analog Analyzer filter set to 40 kHz brickwall filter. The device output PWM frequency was set to 768 kHz unless otherwise noted.

- I_{PVDD} refers to all current that flows through the PVDD supply for the DUT. Any other current sinks not directly related to the DUT current (4) draw were removed.
- I_{DVDD} refers to all current that flows through the DVDD (3.3-V) supply for the DUT. Any other current sinks not directly related to the (5) DUT current draw were removed.

9 Detailed Description

9.1 Overview

The TAS5782M device integrates 4 main building blocks together into a single cohesive device that maximizes sound quality, flexibility, and ease of use. The 4 main building blocks are listed below:

- A stereo audio DAC, boasting a strong Burr-Brown heritage with a highly flexible serial audio port.
- A µCDSP audio processing core, with different RAM and ROM options.
- A flexible closed-loop amplifier capable of operating in stereo or mono, at several different switching frequencies, and with a variety of output voltages and loads.
- An I²C control port for communication with the device

The device requires only two power supplies for proper operation. A DVDD supply is required to power the low-voltage digital and analog circuitry. Another supply, called PVDD, is required to provide power to the output stage of the audio amplifier. The operating range for these supplies is shown in the *Recommended Operating Conditions* table.

Communication with the device is accomplished through the I²C control port. A speaker amplifier fault line is also provided to notify a system controller of the occurrence of an overtemperature , overcurrent, or DC error in the speaker amplifier. Two digital GPIO pins are available for use. In the selectable process flows of the TAS5782M, the GPIO2 pin is used as an SDOUT terminal. The other GPIO is unused.

The μ CDSP audio processing core is pre-programmed with a configurable DSP program. The PPC3 provides a means by which to manipulate the controls associated with that Process Flow.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Power-on-Reset (POR) Function

The TAS5782M device has a power-on reset function. The power-on reset feature resets all of the registers to their default configuration as the device is powering up. When the low-voltage power supply used to power DVDD, AVDD, and CPVDD exceeds the POR threshold, the device sets all of the internal registers to their default values and holds them there until the device receives valid MCLK, SCLK, and LRCK/FS toggling for a period of approximately 4 ms. After the toggling period has passed, the internal reset of the registers is removed and the registers can be programmed via the I²C Control Port.

9.3.2 Device Clocking

The TAS5782M devices have flexible systems for clocking. Internally, the device requires a number of clocks, mostly at related clock rates to function correctly. All of these clocks can be derived from the Serial Audio Interface in one form or another.

Figure 64. Audio Flow with Respective Clocks

Figure 64 shows the basic data flow at basic sample rate (f_s). When the data is brought into the serial audio interface, the data is processed, interpolated and modulated to 128 × f_s before arriving at the current segments for the final digital to analog conversion.

Figure 65 shows the clock tree.

TEXAS INSTRUMENTS

www.ti.com

Feature Description (continued)

Figure 65. TAS5782M Clock Distribution Tree

The Serial Audio Interface typically has 4 connection pins which are listed as follows:

- MCLK (System Master Clock)
- SCLK (Bit Clock)
- LRCK/FS (Left Right Word Clock and Frame Sync)
- SDIN (Input Data)
- The output data, SDOUT, is presented on one of the GPIO pins.
- See the GPIO Port and Hardware Control Pins section)

The device has an internal PLL that is used to take either MCLK or SCLK and create the higher rate clocks required by the DSP and the DAC clock.

In situations where the highest audio performance is required, bringing MCLK to the device along with SCLK and LRCK/FS is recommended. The device should be configured so that the PLL is only providing a clock source to the DSP. All other clocks are then a division of the incoming MCLK. To enable the MCLK as the main source clock, with all others being created as divisions of the incoming MCLK, set the DAC CLK source Mux (SDAC in Figure 65) to use MCLK as a source, rather than the output of the MCLK/PLL Mux.

9.3.3 Serial Audio Port

9.3.3.1 Clock Master Mode from Audio Rate Master Clock

In Master Mode, the device generates bit clock and left-right and frame sync clock and outputs them on the appropriate pins. To configure the device in master mode, first put the device into reset, then use registers SCLKO and LRKO (P0-R9). Then reset the LRCK/FS and SCLK divider counters using bits RSCLK and RLRK (P0-R12). Finally, exit reset.

Figure 66 shows a simplified serial port clock tree for the device in master mode.

Feature Description (continued)

Figure 66. Simplified Clock Tree for MCLK Sourced Master Mode

In master mode, MCLK is an input and SCLK and LRCK/FS are outputs. SCLK and LRCK/FS are integer divisions of MCLK. Master mode with a non-audio rate master clock source requires external GPIO's to use the PLL in standalone mode. The PLL should be configured to ensure that the on-chip processor can be driven at the maximum clock rate. The master mode of operation is described in the *Clock Master from a Non-Audio Rate Master Clock* section.

When used with audio rate master clocks, the register changes that should be done include switching the device into master mode, and setting the divider ratio. An example of the master mode of operations is using 24.576 MHz MCLK as a master clock source and driving the SCLK and LRCK/FS with integer dividers to create 48 kHz sample rate clock output. In master mode, the DAC section of the device is also running from the PLL output. The TAS5782M device is able to meet the specified audio performance while using the internal PLL. However, using the MCLK CMOS oscillator source will have less jitter than the PLL.

To switch the DAC clocks (SDAC in the Figure 65) the following registers should be modified

- DAC and OSR Source Clock Register (P0-R14). Set to 0x30 (MCLK input, and OSR is set to whatever the DAC source is)
- The DAC clock divider should be 16 f_S.
 - 16 × 48 kHz = 768 kHz
 - 24.576 MHz (MCLK in) / 768 kHz = 32
 - Therefore, the divide ratio for register DDAC (P0-R28) should be set to 32. The register mapping gives 0x00 = 1, therefore 32 must be converter to 0x1F (31dec).

9.3.3.2 Clock Master from a Non-Audio Rate Master Clock

The classic example here is running a 96-kHz sampling system. Given the clock tree for the device (shown in Figure 65), a non-audio clock rate cannot be brought into the MCLK to the PLL in master mode. Therefore, the PLL source must be configured to be a GPIO pin, and the output brought back into another GPIO pin.

NSTRUMENTS

FXAS

www.ti.com

Feature Description (continued)

Figure 67. Generating Audio Clocks Using Non-Audio Clock Sources

The clock flow through the system is shown in Figure 67. The newly generated MCLK must be brought out of the device on a GPIO pin, then brought into the MCLK pin for integer division to create SCLK and LRCK/FS outputs.

NOTE

Pull-up resistors should be used on SCLK and LRCK/FS in master mode to ensure the device remains out of sleep mode.

9.3.3.3 Clock Slave Mode with 4-Wire Operation (SCLK, MCLK, LRCK/FS, SDIN)

The TAS5782M device requires a system clock to operate the digital interpolation filters and advanced segment DAC modulators. The system clock is applied at the MCLK input and supports up to 50 MHz. The TAS5782M device system-clock detection circuit automatically senses the system-clock frequency. Common audio sampling frequencies in the bands of 32 kHz, (44.1 – 48 kHz), (88.2 – 96 kHz) are supported.

NOTE

Values in the parentheses are grouped when detected, for example, 88.2 kHz and 96 kHz are detected as *double rate*, 32 kHz, 44.1 kHz and 48 kHz are detected as *single rate* and so on.

Also note, there is one process flow which has only a (1/2)X SRC.

In the presence of a valid bit MCLK, SCLK and LRCK/FS, the device automatically configures the clock tree and PLL to drive the μ CDSP as required.

The sampling frequency detector sets the clock for the digital filter, Delta Sigma Modulator (DSM) and the Negative Charge Pump (NCP) automatically. Table 2 shows examples of system clock frequencies for common audio sampling rates.

Feature Description (continued)

MCLK rates that are not common to standard audio clocks, between 1 MHz and 50 MHz, are supported by configuring various PLL and clock-divider registers directly. In slave mode, auto clock mode should be disabled using P0-R37. Additionally, the user can be required to ignore clock error detection if external clocks are not available for some time during configuration or if the clocks presented on the pins of the device are invalid. The extended programmability allows the device to operate in an advanced mode in which the device becomes a clock master and drive the host serial port with LRCK/FS and SCLK, from a non-audio related clock (for example, using a setting of 12 MHz to generate 44.1 kHz [LRCK/FS] and 2.8224 MHz [SCLK]).

Table 2 shows the timing requirements for the system clock input. For optimal performance, use a clock source with low phase jitter and noise. For MCLK timing requirements, refer to the *Serial Audio Port Timing – Master Mode* section.

| SAMPLING | SYSTEM CLOCK FREQUENCY (f _{MCLK}) (MHz) | | | | | | | | | | | |

(1) This system clock rate is not supported for the given sampling frequency.

(2) This system clock rate is supported by PLL mode.

9.3.3.4 Clock Slave Mode with SCLK PLL to Generate Internal Clocks (3-Wire PCM)

9.3.3.4.1 Clock Generation using the PLL

The TAS5782M device supports a wide range of options to generate the required clocks as shown in Figure 65.

The clocks for the PLL require a source reference clock. This clock is sourced as the incoming SCLK or MCLK, a GPIO can also be used.

The source reference clock for the PLL reference clock is selected by programming the SRCREF value on P0-R13, D[6:4]. The TAS5782M device provides several programmable clock dividers to achieve a variety of sampling rates. See Figure 65.

If PLL functionality is not required, set the PLLEN value on P0-R4, D[0] to 0. In this situation, an external master clock is required.

| CLOCK MULTIPLEXER | | | | | | | | | | | |
|-------------------|------------------------|------------------|--|--|--|--|--|--|--|--|--|
| REGISTER | REGISTER FUNCTION BITS | | | | | | | | | | |
| SREF | PLL Reference | B0-P0-R13-D[6:4] | | | | | | | | | |

| DLRK | External LRCK/FS Div | B0-P0-R33-D[7:0] | | | | | | | | | |

Table 3. PLL Configuration Registers

9.3.3.4.2 PLL Calculation

The TAS5782M device has an on-chip PLL with fractional multiplication to generate the clock frequency required by the Digital Signal Processing blocks. The programmability of the PLL allows operation from a wide variety of clocks that may be available in the system. The PLL input (PLLCKIN) supports clock frequencies from 1 MHz to 50 MHz and is register programmable to enable generation of required sampling rates with fine precision.

The PLL is enabled by default. The PLL can be enabled by writing to P0-R4, D[0]. When the PLL is enabled, the PLL output clock PLLCK is given by Equation 1:

$$PLLCK = \frac{PLLCKIN \times R \times J.D}{P} \text{ or } PLLCK = \frac{PLLCKIN \times R \times K}{P}$$

where

• R = 1, 2, 3,4, ... , 15, 16

J = 4,5,6, . . . 63, and D = 0000, 0001, 0002, . . . 9999

• K = [J value].[D value]

• P = 1, 2, 3, ... 15

(1)

R, J, D, and P are programmable. J is the integer portion of K (the numbers to the left of the decimal point), while D is the fractional portion of K (the numbers to the right of the decimal point, assuming four digits of precision).

9.3.3.4.2.1 Examples:

- If K = 8.5, then J = 8, D = 5000
- If K = 7.12, then J = 7, D = 1200
- If K = 14.03, then J = 14, D = 0300
- If K = 6.0004, then J = 6, D = 0004

When the PLL is enabled and D = 0000, the following conditions must be satisfied:

- 1 MHz \leq (PLLCKIN / P) \leq 20 MHz
- 64 MHz ≤ (PLLCKIN x K x R / P) ≤ 100 MHz
- 1 ≤ J ≤ 63

When the PLL is enabled and $D \neq 0000$, the following conditions must be satisfied:

- 6.667 MHz \leq PLLCLKIN / P \leq 20 MHz
- 64 MHz \leq (PLLCKIN x K x R / P) \leq 100 MHz
- 4 ≤ J ≤ 11
- R = 1

When the PLL is enabled,

• $f_S = (PLLCLKIN \times K \times R) / (2048 \times P)$

The value of N is selected so that f_S × N = PLLCLKIN x K x R / P is in the allowable range.

Example: MCLK = 12 MHz and $f_S = 44.1$ kHz, (N=2048)

Select P = 1, R = 1, K = 7.5264, which results in J = 7, D = 5264

Example: MCLK = 12 MHz and f_s = 48.0 kHz, (N=2048)

Select P = 1, R = 1, K = 8.192, which results in J = 8, D = 1920

Values are written to the registers in Table 4.

| | Table | | | | |
|---------|----------------------|----------------|--|--|--|
| DIVIDER | FUNCTION | BITS | | | |
| PLLE | PLL enable | P0-R4, D[0] | | | |
| PPDV | PLL P | P0-R20, D[3:0] | | | |
| PJDV | PLL J P0-R21, D[5:0] | | | | |
| PDDV | PLL D | P0-R22, D[5:0] | | | |
| PDDV | PLL D | P0-R23, D[7:0] | | | |
| PRDV | PLL R | P0-R24, D[3:0] | | | |

Table 4. PLL Registers

| EQUATIONS | DESCRIPTION |
|----------------------|--|
| f _S (kHz) | Sampling frequency |
| R _{MCLK} | Ratio between sampling frequency and MCLK frequency (MCLK frequency = RMCLK x sampling frequency) |
| MCLK (MHz) | System master clock frequency at MCLK input (pin 20) |
| PLL VCO (MHz) | PLL VCO frequency as PLLCK in Figure 65 |
| Ρ | One of the PLL coefficients in Equation 1 |
| PLL REF (MHz) | Internal reference clock frequency which is produced by MCLK / P |
| $M = K \times R$ | The final PLL multiplication factor computed from K and R as described in Equation 1 |
| K = J.D | One of the PLL coefficients in Equation 1 |
| R | One of the PLL coefficients in Equation 1 |
| PLL f _S | Ratio between f _S and PLL VCO frequency (PLL VCO / f _S) |
| DSP f _S | Ratio between operating clock rate and f _S (PLL f _S / NMAC) |
| NMAC | The clock divider value in Table 3 |
| DSP CLK (MHz) | The operating frequency as DSPCK in Figure 65 |
| MOD f _S | Ratio between DAC operating clock frequency and f _S (PLL f _S / NDAC) |
| MOD f (kHz) | DAC operating frequency as DACCK in |
| NDAC | DAC clock divider value in Table 3 |
| DOSR | OSR clock divider value in Table 3 for generating OSRCK in Figure 65. DOSR must be chosen so that MOD f_S / DOSR = 16 for correct operation. |
| NCP | NCP (negative charge pump) clock divider value in Table 3 |
| CP f | Negative charge pump clock frequency (f _S × MOD f _S / NCP) |
| % Error | Percentage of error between PLL VCO / PLL f_S and f_S (mismatch error). This value is typically zero but can be non-zero especially when K is not an integer (D is not zero). This value can be non-zero only when the TAS5782M device acts as a master. |

The previous equations explain how to calculate all necessary coefficients and controls to configure the PLL. Table 6 provides for easy reference to the recommended clock divider settings for the PLL as a Master Clock.

Table 6. Recommended Clock Divider Settings for PLL as Master Clock (continued)

9.3.3.5 Serial Audio Port – Data Formats and Bit Depths

The serial audio interface port is a 3-wire serial port with the signals LRCK/FS (pin 25), SCLK (pin 23), and SDIN (pin 24). SCLK is the serial audio bit clock, used to clock the serial data present on SDIN into the serial shift register of the audio interface. Serial data is clocked into the TAS5782M device on the rising edge of SCLK. The LRCK/FS pin is the serial audio left/right word clock or frame sync when the device is operated in TDM Mode.

| FORMAT | DATA BITS | MAXIMUM LRCK/FS FREQUENCY (kHz) | MCLK RATE (f _s) | SCLK RATE (f _S) |
|------------------------|----------------|------------------------------------|-----------------------------|-----------------------------|
| I ² S/LJ/RJ | 32, 24, 20, 16 | Up to 96 | 128 to 3072 (≤ 50 MHz) | 64, 48, 32 |
| TDM | 22 24 20 40 | Up to 48 | 128 to 3072 | 125, 256 |
| TDM | 32, 24, 20, 16 | 96 | 128 to 512 | 125, 256 |

Table 7. TAS5782M Audio Data Formats, Bit Depths and Clock Rates

The TAS5782M device requires the synchronization of LRCK/FS and system clock, but does not require a specific phase relation between LRCK/FS and system clock.

If the relationship between LRCK/FS and system clock changes more than ±5 MCLK, internal operation is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCK/FS and system clock is completed.

If the relationship between LRCK/FS and SCLK are invalid more than 4 LRCK/FS periods, internal operation is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCK/FS and SCLK is completed.

9.3.3.5.1 Data Formats and Master/Slave Modes of Operation

The TAS5782M device supports industry-standard audio data formats, including standard I²S and left-justified. Data formats are selected via Register (P0-R40). All formats require binary two's complement, MSB-first audio data; up to 32-bit audio data is accepted. The data formats are detailed in Figure 68 through Figure 73.

The TAS5782M device also supports right-justified, and TDM data. I²S, LJ, RJ, and TDM are selected using Register (P0-R40). All formats require binary 2s complement, MSB-first audio data. Up to 32 bits are accepted. Default setting is I²S and 24 bit word length. The I²S slave timing is shown in Figure 20.

shows a detailed timing diagram for the serial audio interface.

In addition to acting as a I²S slave, the TAS5782M device can act as an I²S master, by generating SCLK and LRCK/FS as outputs from the MCLK input. Table 8 lists the registers used to place the device into Master or Slave mode. Please refer to the *Serial Audio Port Timing – Master Mode* section for serial audio Interface timing requirements in Master Mode. For Slave Mode timing, please refer to the *Serial Audio Port Timing – Slave Mode* section.

Table 8. I²S Master Mode Registers

| REGISTER | FUNCTION |

9.3.3.6 Input Signal Sensing (Power-Save Mode)

The TAS5782M device has a zero-detect function. The zero-detect function can be applied to both channels of data as an AND function or an OR function, via controls provided in the control port in P0-R65-D[2:1].Continuous Zero data cycles are counted by LRCK/FS, and the threshold of decision for analog mute can be set by P0-R59, D[6:4] for the data which is clocked in on the left frame of an I²S signal or Slot 1 of a TDM signal and P0-R59, D[2:0] for the data which is clocked in on the right frame of an I²S signal or Slot 2 of a TDM signal as shown in Table 10. Default values are 0 for both channels.

| ATMUTECTL | VALUE | FUNCTION |
|-----------|-------------|---|
| Bit : 2 | 0 | Zero data triggers for the two channels for zero detection are ORed together. |
| DIL.2 | 1 (Default) | Zero data triggers for the two channels for zero detection are ANDed together. |
| Bit : 1 | 0 | Zero detection and analog mute are disabled for the data clocked in on the right frame of an I ² S signal or Slot 2 of a TDM signal. |
| | 1 (Default) | Zero detection analog mute are enabled for the data clocked in on the right frame of an I ² S signal or Slot 2 of a TDM signal. |
| Bit : 0 | 0 | Zero detection analog mute are disabled for the data clocked in on the left frame of an I ² S signal or Slot 1 of a TDM signal. |
| Bit : U | 1 (Default) | Zero detection analog mute are enabled for the data clocked in on the left frame of an I^2S signal or Slot 1 of a TDM signal. |

Table 9. Zero Detection Mode

| ATMUTETIML OR ATMA | NUMBER OF LRCK/FS CYCLES | TIME at 48 kHz |
|--------------------|--------------------------|----------------|
| 0 0 0 | 1024 | 21 ms |
| 0 0 1 | 5120 | 106 ms |
| 010 | 10240 | 213 ms |
| 011 | 25600 | 533 ms |
| 100 | 51200 | 1.066 secs |
| 1 0 1 | 102400 | 2.133 secs |
| 1 1 0 | 256000 | 5.333 secs |
| 111 | 512000 | 10.66 secs |

9.3.4 Enable Device

To play audio after the device is powered up or reset the device must be enabled by writing book 0x00, page 0x00, register 0x02 to 0x00.

9.3.4.1 Example

The following is a sample script for enabling the device:

#Enable DUT w 90 00 00 #Go to page 0 w 90 7f 00 #Go to book 0 w 90 02 00 #Enable device

9.3.5 Volume Control

For more information regarding the TAS5782 flexible processing system, see the TAS5782M Process Flows

9.3.5.1 DAC Digital Gain Control

Ramp-up frequency and ramp-down frequency can be controlled by P0-R63, D[7:6] and D[3:2] as shown in Table 11. Also ramp-up step and ramp-down step can be controlled by P0-R63, D[5:4] and D[1:0] as shown in Table 12.

| 01 | 2.0 | | 01 | -2.0 | |
| 10 | 1.0 | Default | 10 | -1.0 | Default |
| 11 | 0.5 | | 11 | -0.5 | |

9.3.5.1.1 Emergency Volume Ramp Down

Emergency ramp down of the volume is provided for situations such as I^2S clock error and power supply failure. Ramp-down speed is controlled by P0-R64-D[7:6]. Ramp-down step can be controlled by P0-R64-D[5:4]. Default is ramp-down by every f_S cycle with –4dB step.

9.3.6 Adjustable Amplifier Gain and Switching Frequency Selection

The voltage divider between the GVDD_REG pin and the SPK_GAIN/FREQ pin is used to set the gain and switching frequency of the amplifier. Upon start-up of the device, the voltage presented on the SPK_GAIN/FREQ pin is digitized and then decoded into a 3-bit word which is interpreted inside the TAS5782M device to correspond to a given gain and switching frequency. In order to change the SPK_GAIN or switching frequency of the amplifier, the PVDD must be cycled off and on while the new voltage level is present on the SPK_GAIN/FREQ pin.

Because the amplifier adds gain to both the signal and the noise present in the audio signal, the lowest gain setting that can meet voltage-limited output power targets should be used. Using the lowest gain setting ensures that the power target can be reached while minimizing the idle channel noise of the system. The switching frequency selection affects three important operating characteristics of the device. The three affected characteristics are the power dissipation in the device, the power dissipation in the inductor, and the target output filter for the application.

Higher switching frequencies typically result in slightly higher power dissipation in the TAS5782M device and lower dissipation in the inductor in the system, due to decreased ripple current through the inductor and increased charging and discharging current in device and parasitic capacitances. Switching at the higher of the available switching frequencies will result in lower overall dissipation in the system and lower operating temperature of the inductors. However, the thermally limited power output of the device can be decreased in this situation, because some of the TAS5782M device thermal headroom will be absorbed by the higher switching frequency to reduce the ripple current.

Another advantage of increasing the switching frequency is that the higher frequency carrier signal can be filtered by an L-C filter with a higher corner frequency, leading to physically smaller components. Use the highest switching frequency that continues to meet the thermally limited power targets for the application. If thermal constraints require heat reduction in the TAS5782M device, use a lower switching rate.

The switching frequency of the speaker amplifier is dependent on an internal synchronizing signal, (f_{SYNC}), which is synchronous with the sample rate. The rate of the synchronizing signal is also dependent on the sample rate. Refer to Table 13 below for details regarding how the sample rates correlate to the synchronizing signal.

| SAMPLE RATE [kHz] | f _{SYNC} [kHz] | | | | |
|----------------------|----------------------------|--|--|--|--|
| 8 | | | | | |
| 16 | | | | | |
| 32 | 06 | | | | |
| 48 | 96 | | | | |
| 96 | - | | | | |
| 192 | | | | | |
| 11.025 | | | | | |
| 22.05 | 88.2 | | | | |
| 44.1 | 88.2 | | | | |
| 88.2 | | | | | |

Table 13. Sample Rates vs Synchronization Signal

Table 14 summarizes the de-code of the voltage presented to the SPK_GAIN/FREQ pin. The voltage presented to the SPK_GAIN/FREQ pin is latched in upon startup of the device. Subsequent changes require power cycling the device. A gain setting of 20 dB is recommended for nominal supply voltages of 13 V and lower, while a gain of 26 dB is recommended for supply voltages up to 26.4 V. Table 14 shows the voltage required at the SPK_GAIN/FREQ pin for various gain and switching scenarios as well some example resistor values for meeting the voltage range requirements.

| | | | | U |
|-----------------------|-----------------------|--|-----------|--|
| V _{SPK_GAII} | _{N/FREQ} (V) | RESISTOR EXAMPLES | | |
| MIN | МАХ | R100 (kΩ): RESISTOR TO GROUND R101 (kΩ): RESISTOR TO GVDD_REG | GAIN MODE | AMPLIFIER SWITCHING FREQUENCY MODE |
| 6.61 | 7 | Reserved | Reserved | Reserved |
| 5.44 | 6.6 | R100 = 750 R101 = 150 | | 8 × f _{SYNC} |
| 4.67 | 5.43 | R100 = 390 R101 = 150 | | 6 × f _{SYNC} |
| 3.89 | 4.66 | R100 = 220 R101 = 150 | 26 dBV | 5 × f _{SYNC} |
| 3.11 | 3.88 | R100 = 150 R101 = 150 | | 4 × f _{SYNC} |
| 2.33 | 3.1 | R100 = 100 R101 = 150 | | 8 × f _{SYNC} |
| 1.56 | 2.32 | R100 = 56 R101 = 150 | | 6 × f _{SYNC} |
| 0.78 | 1.55 | R100 = 33 R101 = 150 | 20 dBV | 5 × f _{SYNC} |
| 0 | 0.77 | R100 = 8.2 R101 = 150 | | 4 × f _{SYNC} |

Table 14. Amplifier Switching Mode vs. SPK_GAIN/FREQ Voltage

9.3.7 Error Handling and Protection Suite

9.3.7.1 Device Overtemperature Protection

The TAS5782M device continuously monitors die temperature to ensure the temperature does not exceed the OTE_{THRES} level specified in the *Recommended Operating Conditions* table. If an OTE event occurs, the SPK_FAULT line is pulled low and the SPK_OUTxx outputs transition to high impedance, signifying a fault. This is a non-latched error and the device will attempt to self clear after OTE_{CLRTIME} has passed.

9.3.7.2 SPK_OUTxx Overcurrent Protection

The TAS5782M device continuously monitors the output current of each amplifier output to ensure the output current does not exceed the OCE_{THRES} level specified in the *Recommended Operating Conditions* table. If an OCE event occurs, the SPK_FAULT line is pulled low and the SPK_OUTxx outputs transition to high impedance, signifying a fault. This is a non-latched error and the device will attempt to self clear after $OCE_{CLRTIME}$ has passed.

9.3.7.3 DC Offset Protection

If the TAS5782M device measures a DC offset in the output voltage, the SPK_FAULT line is pulled low and the SPK_OUTxx outputs transition to high impedance, signifying a fault. This latched error requires the SPK_MUTE line to toggle to reset the error. Alternatively, pulling the MCLK, SCLK, or LRCK low causes a clock error, which also resets the device. Normal operation resumes by re-starting the stopped lock.

9.3.7.4 Internal V_{AVDD} Undervoltage-Error Protection

The TAS5782M device internally monitors the AVDD net to protect against the AVDD supply dropping unexpectedly. To enable this feature, P1-R5-B0 is used.

9.3.7.5 Internal V_{PVDD} Undervoltage-Error Protection

If the voltage presented on the PVDD supply drops below the UVE_{THRES(PVDD)} value listed in the *Recommended Operating Conditions* table, the SPK_OUTxx outputs transition to high impedance. This is a self-clearing error, which means that once the PVDD level drops below the level listed in the *Recommended Operating Conditions* table, the device resumes normal operation.

9.3.7.6 Internal V_{PVDD} Overvoltage-Error Protection

If the voltage presented on the PVDD supply exceeds the OVE_{THRES(PVDD)} value listed in the *Recommended Operating Conditions* table, the SPK_OUTxx outputs will transition to high impedance. This is a self-clearing error, which means that once the PVDD level drops below the level listed in the *Recommended Operating Conditions* table, the device will resume normal operation.

NOTE

The voltage presented on the PVDD supply only protects up to the level described in the *Recommended Operating Conditions* table for the PVDD voltage. Exceeding the absolute maximum rating may cause damage and possible device failure, because the levels exceed that which can be protected by the OVE protection circuit.

9.3.7.7 External Undervoltage-Error Protection

The SPK_MUTE pin can also be used to monitor a system voltage, such as a LCD TV backlight, a battery pack in portable device, by using a voltage divider created with two resistors (see Figure 74).

- If the SPK_MUTE pin makes a transition from 1 to 0 over 6 ms or more, the device switches into external undervoltage protection mode, which uses two trigger levels.
- When the SPK_MUTE pin level reaches 2 V, soft mute process begins.
- When the SPK_MUTE pin level reaches 1.2 V, analog output mute engages, regardless of digital audio level, and analog output shutdown begins.

Figure 75 shows a timing diagram for external undervoltage error protection.

NOTE

The SPK_MUTE input pin voltage range is provided in the *Recommended Operating Conditions* table. The ratio of external resistors must produce a voltage within the provided input range. Any increase in power supply (such as power supply positive noise or ripple) can pull the SPK_MUTE pin higher than the level specified in the *Recommended Operating Conditions* table, potentially causing damage to or failure of the device. Therefore, any monitored voltage (including all ripple, power supply variation, resistor divider variation, transient spikes, and others) must be scaled by the resistor divider network to never drive the voltage on the SPK_MUTE pin higher than the maximum level specified in the *Recommended Operating Conditions* table.

<u>When the divider is set correctly, any DC voltage can be monitored.</u> Figure 74 shows a 12-V example of how the SPK_MUTE is used for external undervoltage error protection.

9.3.7.8 Internal Clock Error Notification (CLKE)

When a clock error is detected on the incoming data clock, the TAS5782M device switches to an internal oscillator and continues to the drive the DAC, while attenuating the data from the last known value. Once this process is complete, the DAC outputs will be hard muted to the ground and the class D PWM output will stop switching. The clock error can be monitored at B0-P0-R94 and R95. The clock error status bits are non-latching, except for MCLK halted B0-P0-R95-D[4] and CERF B0-P0-R95-D[0] which are cleared when read.

9.3.8 GPIO Port and Hardware Control Pins

Figure 76. GPIO Port

9.3.9 I²C Communication Port

The TAS5782M device supports the I²C serial bus and the data transmission protocol for standard and fast mode as a slave device. Because the TAS5782M register map spans several books and pages, the user must select the correct book and page before writing individual register bits or bytes. Changing from book to book is accomplished by first changing to page 0x00 by writing 0x00 to register 0x00 and then writing the book number to register 0x7f of page 0. Changing from page to page is accomplished via register 0x00 on each page. The register value selects the register page, from 0 to 255.

9.3.9.1 Slave Address

Table 15. I²C Slave Address

| MSB | | | | | | | LSB |
|-----|---|---|---|---|------|------|------------------|
| 1 | 0 | 0 | 1 | 1 | ADR2 | ADR1 | R/\overline{W} |

The TAS5782M device has 7 bits for the slave address. The first five bits (MSBs) of the slave address are factory preset to 10011 (0x9x). The next two bits of the address byte are the device select bits which can be user-defined by the ADR1 and ADR0 terminals. A maximum of four devices can be connected on the same bus at one time, which gives a range of 0x90, 0x92, 0x94 and 0x96, as detailed in Table 16. Each TAS5782M device responds when it receives the slave address.

| Table 16. I ² C Address | Configuration via | ADR0 and ADR1 Pins |
|------------------------------------|-------------------|--------------------|
|------------------------------------|-------------------|--------------------|

| ADR1 | ADR0 | I ² C SLAVE ADDRESS [R/W] |
|------|------|--------------------------------------|
| 0 | 0 | 0x90 |
| 0 | 1 | 0x92 |
| 1 | 0 | 0x94 |
| 1 | 1 | 0x96 |

9.3.9.2 Register Address Auto-Increment Mode

Auto-increment mode allows multiple sequential register locations to be written to or read back in a single operation, and is especially useful for block write and read operations. The TAS5782M device supports auto-increment mode automatically. Auto-increment stops at page boundaries.

9.3.9.3 Packet Protocol

A master device must control packet protocol, which consists of start condition, slave address, read/write bit, data if write or acknowledge if read, and stop condition. The TAS5782M device supports only slave receivers and slave transmitters.

Figure 77. Packet Protocol

| Tra | ansmitter | М | М | М | S | М | S | М | S | S | М |
|-----|-----------|----|---------------|----|-----|------|-----|------|-----|-----|----|

| Data Type | St | slave address | R/ | ACK | DATA | ACK | DATA | ACK | NACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition Sp = Stop Condition

9.3.9.4 Write Register

A master can write to any TAS5782M device registers using single or multiple accesses. The master sends a TAS5782M device slave address with a write bit, a register address, and the data. If auto-increment is enabled, the address is that of the starting register, followed by the data to be transferred. When the data is received properly, the index register is incremented by 1 automatically. When the index register reaches 0x7F, the next value is 0x0. Table 19 shows the write operation.

Table 19. Write Operation

| Transmitter | М | М | М | S | I | И | S | М | S | М | S | S | М |
|-------------|----|------------|---|-----|-----|-------------|-----|-----------------|-----|-----------------|-----|-----|----|

M = Master Device; S = Slave Device; St = Start Condition Sp = Stop Condition; W = Write; ACK = Acknowledge

9.3.9.5 Read Register

A master can read the TAS5782M device register. The value of the register address is stored in an indirect index register in advance. The master sends a TAS5782M device slave address with a read bit after storing the register address. Then the TAS5782M device transfers the data which the index register points to. When autoincrement is enabled, the index register is incremented by 1 automatically. When the index register reaches 0x7F, the next value is 0x0. Table 20 lists the read operation.

9.4 Device Functional Modes

Because the TAS5782M device is a highly configurable device, numerous modes of operation can exist for the device. For the sake of succinct documentation, these modes are divided into two modes:

- Fundamental operating modes
- Secondary usage modes

Fundamental operating modes are the primary modes of operation that affect the major operational characteristics of the device, which are the most basic configurations that are chosen to ensure compatibility with the intended application or the other components that interact with the device in the final system. Some examples of the operating modes are the communication protocol used by the control port, the output configuration of the amplifier, or the Master/Slave clocking configuration.

The fundamental operating modes are described starting in the Serial Audio Port Operating Modes section.

Secondary usage modes are best described as modes of operation that are used after the fundamental operating modes are chosen to fine tune how the device operates within a given system. These secondary usage modes can include selecting between left justified and right justified Serial Audio Port data formats, or enabling some slight gain/attenuation within the DAC path. Secondary usage modes are accomplished through manipulation of the registers and controls in the I²C control port. Those modes of operation are described in their respective register/bit descriptions and, to avoid redundancy, are not included in this section.

9.4.1 Serial Audio Port Operating Modes

The serial audio port in the TAS5782M device supports industry-standard audio data formats, including I^2 S, Time Division Multiplexing (TDM), Left-Justified (LJ), and Right-Justified (RJ) formats. To select the data format that will be used with the device, controls are provided on P0-R40. The timing diagrams for the serial audio port are shown in the *Serial Audio Port Timing – Slave Mode* section, and the data formats are shown in the *Serial Audio Port Timing – Slave Mode* section.

9.4.2 Communication Port Operating Modes

The TAS5782M device is configured via an I²C communication port. The device does not support a hardware only mode of operation, nor Serial Peripheral Interface (SPI) communication. The I²C Communication Protocol is detailed in the l^2C Communication Port section. The I²C timing requirements are described in the l^2C Bus Timing – Standard and l^2C Bus Timing – Fast sections.

9.4.3 Speaker Amplifier Operating Modes

The TAS5782M device can be used in two different amplifier configurations:

- Stereo Mode
- Mono Mode

9.4.3.1 Stereo Mode

The familiar stereo mode of operation uses the TAS5782M device to amplify two independent signals, which represent the left and right portions of a stereo signal. These amplified left and right audio signals are presented on differential output pairs shown as SPK_OUTA± and SPK_OUTB±. The routing of the audio data which is presented on the SPK_OUTxx outputs can be changed according to the Audio Process Flow which is used and the configuration of registers P0-R42-D[5:4] and P0-R42-D[1:0]. The familiar stereo mode of operation is shown in .

By default, the TAS5782M device is configured to output the Right frame of a I²S input on the Channel A output and the left frame on the Channel B output.

Device Functional Modes (continued)

9.4.3.2 Mono Mode

The mono mode of operation is used to describe operation in which the two outputs of the device are placed in parallel with one another to increase the power sourcing capabilities of the audio output channel. This is also known as Parallel Bridge Tied Load (PBTL).

On the output side of the TAS5782M device, the summation of the devices can be done before the filter in a configuration called Pre-Filter PBTL. However, the two outputs may be required to merge together after the inductor portion of the output filter. Doing so does require two additional inductors, but allows smaller, less expensive inductors to be used because the current is divided between the two inductors. This process is called *Post-Filter PBTL*. Both variants of mono operation are shown in Figure 78 and Figure 79.

Figure 78. Pre-Filter PBTL

Figure 79. Post-Filter PBTL

On the input side of the TAS5782M device, the input signal to the mono amplifier can be selected from the any slot in a TDM stream or the left or right frame from an I²S, LJ, or RJ signal. The TAS5782M device can also be configured to amplify some mixture of two signals, as in the case of a subwoofer channel which mixes the left and right channel together and sends the mixture through a low-pass filter to create a mono, low-frequency signal.

The mono mode of operation is shown in the *Mono (PBTL) Systems* section.

9.4.3.3 Master and Slave Mode Clocking for Digital Serial Audio Port

The digital audio serial port in the TAS5782M device can be configured to receive clocks from another device as a serial audio slave device. The slave mode of operation is described in the *Clock Slave Mode with SCLK PLL to Generate Internal Clocks (3-Wire PCM)* section. If no system processor is available to provide the audio clocks, the TAS5782M device can be placed into Master Mode. In master mode, the TAS5782M device provides the clocks to the other audio devices in the system. For more details regarding the Master and Slave mode operation within the TAS5782M device, see the *Serial Audio Port Operating Modes* section.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

This section details the information required to configure the device for several popular configurations and provides guidance on integrating the TAS5782M device into the larger system.

10.1.1 External Component Selection Criteria

The Supporting Component Requirements table in each application description section lists the details of the supporting required components in each of the System Application Schematics.

Where possible, the supporting component requirements have been consolidated to minimize the number of unique components which are used in the design. Component list consolidation is a method to reduce the number of unique part numbers in a design, to ease inventory management, and to reduce the manufacturing steps during board assembly. For this reason, some capacitors are specified at a higher voltage than what would normally be required. An example of this is a 50-V capacitor may be used for decoupling of a 3.3-V power supply net.

In this example, a higher voltage capacitor can be used even on the lower voltage net to consolidate all caps of that value into a single component type. Similarly, several unique resistors that have all the same size and value but different power ratings can be consolidated by using the highest rated power resistor for each instance of that resistor value.

While this consolidation can seem excessive, the benefits of having fewer components in the design can far outweigh the trivial cost of a higher voltage capacitor. If lower voltage capacitors are already available elsewhere in the design, they can be used instead of the higher voltage capacitors. In all situations, the voltage rating of the capacitors must be at least 1.45 times the voltage of the voltage which appears across them. The power rating of the capacitors should be 1.5 times to 1.75 times the power dissipated in it during normal use case.

10.1.2 Component Selection Impact on Board Layout, Component Placement, and Trace Routing

Because the layout is important to the overall performance of the circuit, the package size of the components shown in the component list was intentionally chosen to allow for proper board layout, component placement, and trace routing. In some cases, traces are passed in between two surface mount pads or ground plane extensions from the TAS5782M device and into to the surrounding copper for increased heat-sinking of the device. While components may be offered in smaller or larger package sizes, it is highly recommended that the package size remain identical to the size used in the application circuit as shown. This consistency ensures that the layout and routing can be matched very closely, which optimizes thermal, electromagnetic, and audio performance of the TAS5782M device in circuit in the final system.

10.1.3 Amplifier Output Filtering

The TAS5782M device is often used with a low-pass filter, which is used to filter out the carrier frequency of the PWM modulated output. This filter is frequently referred to as the *L*-*C* Filter, due to the presence of an inductive element L and a capacitive element C to make up the 2-pole filter.

The L-C filter removes the carrier frequency, reducing electromagnetic emissions and smoothing the current waveform which is drawn from the power supply. The presence and size of the L-C filter is determined by several system level constraints. In some low-power use cases that have no other circuits which are sensitive to EMI, a simple ferrite bead or a ferrite bead plus a capacitor can replace the traditional large inductor and capacitor that are commonly used. In other high-power applications, large toroid inductors are required for maximum power and film capacitors can be used due to audio characteristics. Refer to the application report *Class-D LC Filter Design* (SLOA119) for a detailed description on the proper component selection and design of an L-C filter based upon the desired load and response.

Application Information (continued)

10.1.4 Programming the TAS5782M

The TAS5782M device includes an I²C compatible control port to configure the internal registers of the TAS5782M device. The control console software provided by TI is required to configure the device. More details regarding programming steps, and a few important notes are available below and also in the design examples that follow.

10.1.4.1 Resetting the TAS5782M Registers and Modules

The TAS5782M device has several methods by which the device can reset the register, interpolation filters, and DAC modules. The registers offer the flexibility to do these in or out of shutdown as well as in or out of standby. However, there can be issues if the reset bits are toggled in certain illegal operation modes.

Any of the following routines can be used with no issue:

- Reset Routine 1
 - Place device in Standby
 - Reset modules
- Reset Routine 2
 - Place device in Standby + Power Down
 - Reset registers
- Reset Routine 3
 - Place device in Power Down
- Reset registers
- Reset Routine 4
 - Place device in Standby
 - Reset registers
- Reset Routine 5
 - Place device in Standby + Power Down
 - Reset modules + Reset registers
- Reset Routine 6
 - Place device in Power Down
 - Reset modules + Reset registers
- Reset Routine 7
 - Place device in Standby
 - Reset modules + Reset registers

Two reset routines are not supported and should be avoided. If used, they can cause the device to become unresponsive. These unsupported routines are shown below.

- Unsupported Reset Routine 1 (do not use)
 - Place device in Standby + Power Down
 - Reset modules
- Unsupported Reset Routine 2 (do not use)
 - Place device in Power Down
 - Reset modules

10.2 Typical Applications

10.2.1 2.0 (Stereo BTL) System

For the stereo (BTL) PCB layout, see Figure 85.

A 2.0 system refers to a system in which there are two full range speakers without a separate amplifier path for the speakers which reproduce the low-frequency content. In this system, two channels are presented to the amplifier via the digital input signal. These two channels are amplified and then sent to two separate speakers. In some cases, the amplified signal is further separated based upon frequency by a passive crossover network after the L-C filter. Even so, the application is considered 2.0.

Most commonly, the two channels are a pair of signals called a *stereo pair*, with one channel containing the audio for the left channel and the other channel containing the audio for the right channel. While certainly the two channels can contain any two audio channels, such as two surround channels of a multi-channel speaker system, the most popular occurrence in two channels systems is a stereo pair.

Figure 80 shows the 2.0 (Stereo BTL) system application.

Figure 80. 2.0 (Stereo BTL) System Application Schematic

10.2.1.1 Design Requirements

- Power supplies:
 - 3.3-V supply
 - 5-V to 24-V supply
- Communication: host processor serving as I²C compliant master
- External memory (such as EEPROM and flash) used for coefficients

The requirements for the supporting components for the TAS5782M device in a Stereo 2.0 (BTL) system is provided in Table 21.

Table 21. Supporting Component Requirements for Stereo 2.0 (BTL) Systems

| REFERENCE DESIGNATOR | VALUE | SIZE | DETAILED DESCRIPTION | | | |
|---------------------------|--|---|--|--|--|--|
| U100 | TAS5782M | 48 Pin TSSOP | Digital-input, closed-loop class-D amplifier | | | |
| R100 | See the Adjustable | 0402 | 1%, 0.063 W | | | |
| R101 | Amplifier Gain and Switching Frequency Selection section | 0402 | 1%, 0.063 W | | | |
| L100, L101, L102, L103 | 01, L102, See the <i>Amplifier Output Filtering</i> section | | | | | |
| C100, C121 | 0.1 µF | 0402 | Ceramic, 0.1 µF, ±10%, X7R Voltage rating must be > 1.45 × V _{PVDD} | | | |
| C104, C108, C111, C115 | 0.22 µF | 0603 | Ceramic, 0.22 μ F, ±10%, X7R Voltage rating must be > 1.45 × V _{PVDD} | | | |
| C109, C110, C116, C117 | 0.68 µF | 0805 | Ceramic, 0.68 μ F, ±10%, X7R Voltage rating must be > 1.8 × V _{PVDD} | | | |
| C103 | 1 µF | 0603 (this body size chosen to aid in trace routing) | Ceramic, 1 μF, ±10%, X7R Voltage rating must be > 16 V | | | |
| C105, C118, C119, C120 | 1 µF | 0402 | Ceramic, 1 µF, 6.3V, ±10%, X5R | | | |
| C106, C107, C113, C114 | 2.2 µF | 0402 | Ceramic, 2.2 μ F, ±10%, X5R At a minimum, voltage rating must be > 10V, however higher voltage caps have been shown to have better stability under DC bias. Refer to the guidance provided in the TAS5782M for suggested values. | | | |
| C101, C102, C122, C123 | 22 µF | 0805 | Ceramic, 22 μ F, ±20%, X5R Voltage rating must be > 1.45 × V _{PVDD} | | | |

10.2.1.2 Detailed Design Procedure

10.2.1.2.1 Step One: Hardware Integration

- Using the Typical Application Schematic as a guide, integrate the hardware into the system schematic.
- Following the recommended component placement, board layout, and routing given in the example layout above, integrate the device and its supporting components into the system PCB file.
 - The most critical sections of the circuit are the power supply inputs, the amplifier output signals, and the high-frequency signals, all of which go to the serial audio port. Constructing these signals to ensure they are given precedent as design trade-offs are made is recommended.
 - For questions and support go to the E2E forums (e2e.ti.com). If deviating from the recommended layout is
 necessary, go to the E2E forum to request a layout review.

10.2.1.2.2 Step Two: System Level Tuning

• Use the TAS5782MEVM evaluation module and the PPC3 app to configure the desired device settings.

10.2.1.2.3 Step Three: Software Integration

- Use the End System Integration feature of the PPC3 app to generate a baseline configuration file.
- Generate additional configuration files based upon operating modes of the end-equipment and integrate static configuration information into initialization files.
- Integrate dynamic controls (such as volume controls, mute commands, and mode-based EQ curves) into the main system program.

10.2.1.3 Application Curves

Table 22 shows the application specific performance plots for Stereo 2.0 (BTL) systems.

10.2.2 Mono (PBTL) Systems

For the mono (PBTL) PCB layout, see Figure 87.

A mono system refers to a system in which the amplifier is used to drive a single loudspeaker. Parallel Bridge Tied Load (PBTL) indicates that the two full-bridge channels of the device are placed in parallel and drive the loudspeaker simultaneously using an identical audio signal. The primary benefit of operating the TAS5782M device in PBTL operation is to reduce the power dissipation and increase the current sourcing capabilities of the amplifier output. In this mode of operation, the current limit of the audio amplifier is approximately doubled while the on-resistance is approximately halved.

The loudspeaker can be a full-range transducer or one that only reproduces the low-frequency content of an audio signal, as in the case of a powered subwoofer. Often in this use case, two stereo signals are mixed together and sent through a low-pass filter to create a single audio signal which contains the low frequency information of the two channels. Conversely, advanced digital signal processing can create a low-frequency signal for a multichannel system, with audio processing which is specifically targeted on low-frequency effects.

Because low-frequency signals are not perceived as having a direction (at least to the extent of high-frequency signals) it is common to reproduce the low-frequency content of a stereo signal that is sent to two separate channels. This configuration pairs one device in Mono PBTL configuration and another device in Stereo BTL configuration in a single system called a 2.1 system. The Mono PBTL configuration is detailed in the 2.1 (Stereo BTL + External Mono Amplifier) Systems section. shows the Mono (PBTL) system application

10.2.3 2.1 (Stereo BTL + External Mono Amplifier) Systems

Figure 89 shows the PCB Layout for the 2.1 System.

To increase the low-frequency output capabilities of an audio system, a single subwoofer can be added to the system. Because the spatial clues for audio are predominately higher frequency than that reproduced by the subwoofer, often a single subwoofer can be used to reproduce the low frequency content of several other channels in the system. This is frequently referred to as a *dot one* system. A stereo system with a subwoofer is referred to as a 2.1 (two-dot-one), a 3 channel system with subwoofer is referred to as a 3.1 (three-dot-one), a popular surround system with five speakers and one subwoofer is referred to as a 5.1, and so on.

10.2.3.1 Advanced 2.1 System (Two TAS5782M devices)

In higher performance systems, the subwoofer output can be enhanced using digital audio processing as was done in the high-frequency channels. To accomplish this, two TAS5782M devices are used — one for the high frequency left and right speakers and one for the mono subwoofer speaker. In this system, the audio signal can be sent from the TAS5782M device through the SDOUT pin. Alternatively, the subwoofer amplifier can accept the same digital input as the stereo, which might come from a central systems processor. Figure 82 shows the 2.1 (Stereo BTL + External Mono Amplifier) system application.

11 Power Supply Recommendations

11.1 Power Supplies

The TAS5782M device requires two power supplies for proper operation. A *high-voltage* supply called PVDD is required to power the output stage of the speaker amplifier and its associated circuitry. Additionally, one *low-voltage* power supply which is called DVDD is required to power the various low-power portions of the device. The allowable voltage range for both the PVDD and the DVDD supply are listed in the *Recommended Operating Conditions* table. The two power supplies do not have a required powerup sequence. The power supplies can be powered on in any order. TI recommends waiting 100 ms to 240 ms for the DVDD power supplies to stabilize before starting I²C communication and providing stable I²S clock before enabling the device outputs.

Figure 83. Power Supply Functional Block Diagram

11.1.1 DVDD Supply

The DVDD supply that is required from the system is used to power several portions of the device. As shown in *Figure 83*, it provides power to the DVDD pin, the CPVDD pin, and the AVDD pin. Proper connection, routing, and decoupling techniques are highlighted in the *Application and Implementation* section and the *Layout Example* section) and must be followed as closely as possible for proper operation and performance. Deviation from the guidance offered in the TAS5782M device *Application and Implementation* section can result in reduced performance, errant functionality, or even damage to the TAS5782M device.

Some portions of the device also require a separate power supply that is a lower voltage than the DVDD supply. To simplify the power supply requirements for the system, the TAS5782M device includes an integrated lowdropout (LDO) linear regulator to create this supply. This linear regulator is internally connected to the DVDD supply and its output is presented on the DVDD_REG pin, providing a connection point for an external bypass capacitor. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

Power Supplies (continued)

The outputs of the high-performance DACs used in the TAS5782M device are ground centered, requiring both a positive low-voltage supply and a negative low-voltage supply. The positive power supply for the DAC output stage is taken from the AVDD pin, which is connected to the DVDD supply provided by the system. A charge pump is integrated in the TAS5782M device to generate the negative low-voltage supply. The power supply input for the charge pump is the CPVDD pin. The CPVSS pin is provided to allow the connection of a filter capacitor on the negative low-voltage supply. As is the case with the other supplies, the component selection, placement, and routing of the external components for these low voltage supplies are shown in the TAS5782M and should be followed as closely as possible to ensure proper operation of the device.

11.1.2 PVDD Supply

The output stage of the speaker amplifier drives the load using the PVDD supply. This is the power supply which provides the drive current to the load during playback. Proper connection, routing, and decoupling techniques are highlighted in the TAS5782MEVM and must be followed as closely as possible for proper operation and performance. Due to the high-voltage switching of the output stage, it is particularly important to properly decouple the output power stages in the manner described in the TAS5782M deviceApplication and Implementation . Lack of proper decoupling, like that shown in the Application and Implementation , results in voltage spikes which can damage the device.

A separate power supply is required to drive the gates of the MOSFETs used in the output stage of the speaker amplifier. This power supply is derived from the PVDD supply via an integrated linear regulator. A GVDD_REG pin is provided for the attachment of decoupling capacitor for the gate drive voltage regulator. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

12 Layout

12.1 Layout Guidelines

12.1.1 General Guidelines for Audio Amplifiers

Audio amplifiers which incorporate switching output stages must have special attention paid to their layout and the layout of the supporting components used around them. The system level performance metrics, including thermal performance, electromagnetic compliance (EMC), device reliability, and audio performance are all affected by the device and supporting component layout.

Ideally, the guidance provided in the applications section with regard to device and component selection can be followed by precise adherence to the layout guidance shown in Layout Example. These examples represent exemplary *baseline* balance of the engineering trade-offs involved with laying out the device. These designs can be modified slightly as needed to meet the needs of a given application. In some applications, for instance, solution size can be compromised to improve thermal performance through the use of additional contiguous copper near the device. Conversely, EMI performance can be prioritized over thermal performance by routing on internal traces and incorporating a via picket-fence and additional filtering components. In all cases, it is recommended to start from the guidance shown in the *Layout Example* section and work with TI field application engineers or through the E2E community to modify it based upon the application specific goals.

12.1.2 Importance of PVDD Bypass Capacitor Placement on PVDD Network

Placing the bypassing and decoupling capacitors close to supply has long been understood in the industry. This applies to DVDD, AVDD, CPVDD, and PVDD. However, the capacitors on the PVDD net for the TAS5782M device deserve special attention.

The small bypass capacitors on the PVDD lines of the DUT must be placed as close to the PVDD pins as possible. Not only does placing these devices far away from the pins increase the electromagnetic interference in the system, but doing so can also negatively affect the reliability of the device. Placement of these components too far from the TAS5782M device can cause ringing on the output pins that can cause the voltage on the output pin to exceed the maximum allowable ratings shown in the *Absolute Maximum Ratings* table, damaging the device. For that reason, the capacitors on the PVDD net must be no further away from their associated PVDD pins than what is shown in the example layouts in the *Layout Example* section

12.1.3 Optimizing Thermal Performance

Follow the layout examples shown in the *Layout Example* section of this document to achieve the best balance of solution size, thermal, audio, and electromagnetic performance. In some cases, deviation from this guidance can be required due to design constraints which cannot be avoided. In these instances, the system designer should ensure that the heat can get out of the device and into the ambient air surrounding the device. Fortunately, the heat created in the device naturally travels away from the device and into the lower temperature structures around the device.

12.1.3.1 Device, Copper, and Component Layout

Primarily, the goal of the PCB design is to minimize the thermal impedance in the path to those cooler structures. These tips should be followed to achieve that goal:

- Avoid placing other heat producing components or structures near the amplifier (including above or below in the end equipment).
- If possible, use a higher layer count PCB to provide more heat sinking capability for the TAS5782M device and to prevent traces and copper signal and power planes from breaking up the contiguous copper on the top and bottom layer.
- Place the TAS5782M device away from the edge of the PCB when possible to ensure that heat can travel away from the device on all four sides.
- Avoid cutting off the flow of heat from the TAS5782M device to the surrounding areas with traces or via strings. Instead, route traces perpendicular to the device and line up vias in columns which are perpendicular to the device.
- Unless the area between two pads of a passive component is large enough to allow copper to flow in between the two pads, orient it so that the narrow end of the passive component is facing the TAS5782M device.

Layout Guidelines (continued)

• Because the ground pins are the best conductors of heat in the package, maintain a contiguous ground plane from the ground pins to the PCB area surrounding the device for as many of the ground pins as possible.

12.1.3.2 Stencil Pattern

The recommended drawings for the TAS5782M device PCB foot print and associated stencil pattern are shown at the end of this document in the package addendum. Additionally, baseline recommendations for the via arrangement under and around the device are given as a starting point for the PCB design. This guidance is provided to suit the majority of manufacturing capabilities in the industry and prioritizes manufacturability over all other performance criteria. In elevated ambient temperatures or under high-power dissipation use-cases, this guidance may be too conservative and advanced PCB design techniques may be used to improve thermal performance of the system.

NOTE

The customer must verify that deviation from the guidance shown in the package addendum, including the deviation explained in this section, meets the customer's quality, reliability, and manufacturability goals.

12.1.3.2.1 PCB footprint and Via Arrangement

The PCB footprint (also known as a *symbol* or *land pattern*) communicates to the PCB fabrication vendor the shape and position of the copper patterns to which the TAS5782M device will be soldered. This footprint can be followed directly from the guidance in the package addendum at the end of this data sheet. It is important to make sure that the thermal pad, which connects electrically and thermally to the PowerPAD of the TAS5782M device, be made no smaller than what is specified in the package addendum. This ensures that the TAS5782M device has the largest interface possible to move heat from the device to the board.

The via pattern shown in the package addendum provides an improved interface to carry the heat from the device through to the layers of the PCB, because small diameter plated vias (with minimally-sized annular rings) present a low thermal-impedance path from the device into the PCB. Once into the PCB, the heat travels away from the device and into the surrounding structures and air. By increasing the number of vias, as shown in the *Layout Example* section, this interface can benefit from improved thermal performance.

NOTE

Vias can obstruct heat flow if they are not constructed properly.

More notes on the construction and placement of vias as as follows:

- Remove thermal reliefs on thermal vias, because they impede the flow of heat through the via.
- Vias filled with thermally conductive material are best, but a simple plated via can be used to avoid the additional cost of filled vias.
- The diameter of the drull must be 8 mm or less. Also, the distance between the via barrel and the surrounding planes should be minimized to help heat flow from the via into the surrounding copper material. In all cases, minimum spacing should be determined by the voltages present on the planes surrounding the via and minimized wherever possible.
- Vias should be arranged in columns, which extend in a line radially from the heat source to the surrounding area. This arrangement is shown in the *Layout Example* section.
- Ensure that vias do not cut off power current flow from the power supply through the planes on internal layers. If needed, remove some vias that are farthest from the TAS5782M device to open up the current path to and from the device.

12.1.3.2.1.1 Solder Stencil

During the PCB assembly process, a piece of metal called a *stencil* on top of the PCB and deposits solder paste on the PCB wherever there is an opening (called an aperture) in the stencil. The stencil determines the quantity and the location of solder paste that is applied to the PCB in the electronic manufacturing process. In most cases, the aperture for each of the component pads is almost the same size as the pad itself.

Layout Guidelines (continued)

However, the thermal pad on the PCB is large and depositing a large, single deposition of solder paste would lead to manufacturing issues. Instead, the solder is applied to the board in multiple apertures, to allow the solder paste to outgas during the assembly process and reduce the risk of solder bridging under the device. This structure is called an aperture array, and is shown in the *Layout Example* section. It is important that the total area of the aperture array (the area of all of the small apertures combined) covers between 70% and 80% of the area of the thermal pad itself.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 28. Register 2 (0x02) Field Descriptions

| Bit | Field | Туре | Reset | Description |
|-----|----------|---------|-------|---|
| 7 | DSPR | R/W | 1 | DSP reset – When the bit is made 0, DSP will start powering up and send out data. This needs to be made 0 only after all the input clocks are (ASI,MCLK,PLLCLK) are settled so that DMA channels do not go out of sync. |
| | | | | 0: Normal operation 1: Reset the DSP |
| 6-5 | Reserved | R/W | | Reserved |
| 4 | RQST | QST R/W | 0 | Standby Request – When this bit is set, the DAC will be forced into a system standby mode, which is also the mode the system enters in the case of clock errors. In this mode, most subsystems will be powered down but the charge pump and digital power supply. |
| | | | | 0: Normal operation 1: Standby mode |
| 3-1 | Reserved | R/W | | Reserved |
| 0 | RQPD | R/W | 0 | Powerdown Request – When this bit is set, the DAC will be forced into powerdown mode, in which the power consumption would be minimum as the charge pump is also powered down. However, it will take longer to restart from this mode. This mode has higher precedence than the standby mode, i.e. setting this bit along with bit 4 for standby mode will result in the DAC going into powerdown mode. |
| | | | | 0: Normal operation 1: Powerdown mode |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 55. Register 37 (0x25) Field Descriptions

| Bit | Field | Туре | Reset | Description |
|-----|----------|------|-------|--|
| 7 | Reserved | R/W | | Reserved |
| 6 | IDFS | R/W | 0 | Ignore FS Detection – This bit controls whether to ignore the FS detection. When ignored, FS error will not cause a clock error. |
| | | | | 0: Regard FS detection 1: Ignore FS detection |
| 5 | IDBK | R/W | 0 | Ignore SCLK Detection – This bit controls whether to ignore the SCLK detection against LRCLK. The SCLK must be stable between 32 FS and 256 FS inclusive or an error will be reported. When ignored, a SCLK error will not cause a clock error. |
| | | | | 0: Regard SCLK detection 1: Ignore SCLK detection |
| 4 | IDSK | R/W | 0 | Ignore MCLK Detection – This bit controls whether to ignore the MCLK detection against LRCLK. Only some certain MCLK ratios within some error margin are allowed. When ignored, an MCLK error will not cause a clock error. |
| | | | | 0: Regard MCLK detection 1: Ignore MCLK detection |
| 3 | IDCH | R/W | 0 | Ignore Clock Halt Detection – This bit controls whether to ignore the MCLK halt (static or frequency is lower than acceptable) detection. When ignored an MCLK halt will not cause a clock error. |
| | | | | 0: Regard MCLK halt detection 1: Ignore MCLK halt detection |
| 2 | IDCM | R/W | 0 | Ignore LRCLK/SCLK Missing Detection – This bit controls whether to ignore the LRCLK/SCLK missing detection. The LRCLK/SCLK need to be in low state (not only static) to be deemed missing. When ignored an LRCLK/SCLK missing will not cause the DAC go into powerdown mode. |
| | | | | 0: Regard LRCLK/SCLK missing detection 1: Ignore LRCLK/SCLK missing detection |
| 1 | DCAS | R/W | 0 | Disable Clock Divider Autoset – This bit enables or disables the clock auto set mode. When dealing with uncommon audio clock configuration, the auto set mode must be disabled and all clock dividers must be set manually. |
| | | | | Additionally, some clock detectors might also need to be disabled. The clock autoset feature will not work with PLL enabled in VCOM mode. In this case this feature has to be disabled and the clock dividers must be set manually. |
| | | | | 0: Enable clock auto set 1: Disable clock auto set |
| 0 | IPLK | R/W | 0 | Ignore PLL Lock Detection – This bit controls whether to ignore the PLL lock detection. When ignored, PLL unlocks will not cause a clock error. The PLL lock flag at P0-R4, bit 4 is always correct regardless of this bit. |
| | | | | 0: PLL unlocks raise clock error 1: PLL unlocks are ignored |

|-----|----------|------|-------|---|
| 7 | Reserved | R/W | 0 | Reserved |
| 6 | CDST6 | R | | Clock Detector Status - This bit indicates whether the MCLK clock is present or not. |
| | | | | 0: MCLK is present 1: MCLK is missing (halted) |
| 5 | CDST5 | R | | This bit indicates whether the PLL is locked or not. The PLL will be reported as unlocked when it is disabled. |
| | | | | 0: PLL is locked 1: PLL is unlocked |
| 4 | CDST4 | R | | This bit indicates whether the both LRCLK and SCLK are missing (tied low) or not. |
| | | | | 0: LRCLK and/or SCLK is present 1: LRCLK and SCLK are missing |
| 3 | CDST3 | R | | This bit indicates whether the combination of current sampling rate and MCLK ratio is valid for clock auto set. |
| | | | | 0: The combination of FS/MCLK ratio is valid 1: Error (clock auto set is not possible) |
| 2 | CDST2 | R | | This bit indicates whether the MCLK is valid or not. The MCLK ratio must be detectable to be valid. There is a limitation with this flag, that is, when the low period of LRCLK is less than or equal to five SCLKs, this flag will be asserted (MCLK invalid reported). |
| | | | | 0: MCLK is valid 1: MCLK is invalid |
| 1 | CDST1 | R | | This bit indicates whether the SCLK is valid or not. The SCLK ratio must be stable and in the range of 32-256FS to be valid. |
| | | | | 0: SCLK is valid 1: SCLK is invalid |
| 0 | CDST0 | R | | This bit indicated whether the audio sampling rate is valid or not. The sampling rate must be detectable to be valid. There is a limitation with this flag, that is when this flag is asserted and P0-R37 is set to ignore all asserted error flags such that the DAC recovers, this flag will be de-asserted (sampling rate invalid not reported anymore). |
| | | | | 0: Sampling rate is valid 1: Sampling rate is invalid |

14 Device and Documentation Support

14.1 Device Support

14.1.1 Device Nomenclature

The glossary listed in the *Glossary* section is a general glossary with commonly used acronyms and words which are defined in accordance with a broad TI initiative to comply with industry standards such as JEDEC, IPC, IEEE, and others. The glossary provided in this section defines words, phrases, and acronyms that are unique to this product and documentation, collateral, or support tools and software used with this product. For any additional questions regarding definitions and terminology, please see the e2e Audio Amplfier Forum.

Bridge tied load (BTL) is an output configuration in which one terminal of the speaker is connected to one halfbridge and the other terminal is connected to another half-bridge.

DUT refers to a *device under test* to differentiate one device from another.

Closed-loop architecture describes a topology in which the amplifier monitors the output terminals, comparing the output signal to the input signal and attempts to correct for non-linearities in the output.

Dynamic controls are those which are changed during normal use by either the system or the end-user.

GPIO is a general purpose input/output pin. It is a highly configurable, bi-directional digital pin which can perform many functions as required by the system.

Host processor (also known as System Processor, Scalar, Host, or System Controller) refers to device which serves as a central system controller, providing control information to devices connected to it as well as gathering audio source data from devices upstream from it and distributing it to other devices. This device often configures the controls of the audio processing devices (like the TAS5782M) in the audio path in order to optimize the audio output of a loudspeaker based on frequency response, time alignment, target sound pressure level, safe operating area of the system, and user preference.

HybridFlow uses components which are built in RAM and components which are built in ROM to make a configurable device that is easier to use than a fully-programmable device while remaining flexible enough to be used in several applications

Maximum continuous output power refers to the maximum output power that the amplifier can continuously deliver without shutting down when operated in a 25°C ambient temperature. Testing is performed for the period of time required that their temperatures reach thermal equilibrium and are no longer increasing

Parallel bridge tied load (PBTL) is an output configuration in which one terminal of the speaker is connected to two half-bridges which have been placed in parallel and the other terminal is connected to another pair of half bridges placed in parallel

r_{DS(on)} is a measure of the on-resistance of the MOSFETs used in the output stage of the amplifier.

Static controls/Static configurations are controls which do not change while the system is in normal use.

Vias are copper-plated through-hole in a PCB.

14.1.2 Development Support

For RDGUI software, please consult your local field support engineer.

14.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

14.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E[™] Online Community TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support TI's Design Support Quickly find helpful E2E forums along with design support tools and contact information for technical support.

14.4 Trademarks

Burr Brown, PowerPAD, E2E are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

14.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

14.6 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

Mechanical, Packaging, and Orderable Information 15

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

TAS5782M SLASEG8-MARCH 2017

29-Mar-2017

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|----------------------------|-------------------------|---------------------|--------------|-------------------------|---------|
| TAS5782MDCA | ACTIVE | HTSSOP | DCA | 48 | 40 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | -25 to 85 | BURR-BROWN TAS5782M | Samples |
| TAS5782MDCAR | ACTIVE | HTSSOP | DCA | 48 | 2000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | -25 to 85 | BURR-BROWN TAS5782M | Samples |

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between

the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

29-Mar-2017

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DCA (R-PDSO-G48)

PowerPAD[™] PLASTIC SMALL-OUTLINE

- NOTES: Α. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - Β. This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion not to exceed 0,15. C.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com http://www.ti.com.
 E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

 - F. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

DCA (R-PDSO-G48)

PowerPAD[™] PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD^{\mathbb{N}} package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: A. All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's noncompliance with the terms and provisions of this Notice.
