Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. Either or both input voltages should not exceed the magnitude of V_{CC} or V_{EE}.
2. Power dissipation must be considered to ensure maximum junction temperature (T_J) is not exceeded.

For circuit stability, ensure that $R_x > \frac{2R_3 \cdot R_1}{R_M}$ where, R_M = internal resistance of motor.
 The voltage available at the terminals of the motor is: $V_M = 2(V_1 - \frac{V_S}{2}) + |R_0| \cdot I_M$
 where, $|R_0| = \frac{2R_3 \cdot R_1}{R_x}$ and I_M is the motor current.
