LED DRIVER

Check for Samples: TLC5922

FEATURES

- **16 Channels**
- **Drive Capability**
  - **0 to 80 mA (Constant-Current Sink)**
- **Constant Current Accuracy**
  - **±1% (typical)**
- **Serial Data Interface, SPI Compatible**
- **Fast Switching Output: T_r / T_f = 10ns (typical)**
- **CMOS Level Input/Output**
- **30 MHz Data Transfer Rate**
- **V_{CC} = 3.0 V to 5.5 V**
- **Operating Temperature = −20°C to 85 °C**
- **LED Supply Voltage up to 17 V**
- **32-pin HTSSOP (PowerPAD™) Package**
- **Dot Correction**
  - **7 bit (128 Steps)**
  - **Individually Adjustable For Each Channel**
- **Controlled In-Rush Current**

APPLICATIONS

- **Monocolor, Multicolor, Fullcolor LED Display**
- **Monocolor, Multicolor LED Signboard**
- **Display Backlighting**
- **Multicolor LED Lighting Applications**

DESCRIPTION

The TLC5922 is a 16-channel constant-current sink driver. Each channel has an On/Off state and a 128-step adjustable constant-current sink (dot correction). The dot correction adjusts the brightness variations between LED, LED channels, and other LED drivers. Both dot correction and On/Off state are accessible via a serial data interface. A single external resistor sets the maximum current of all 16 channels.

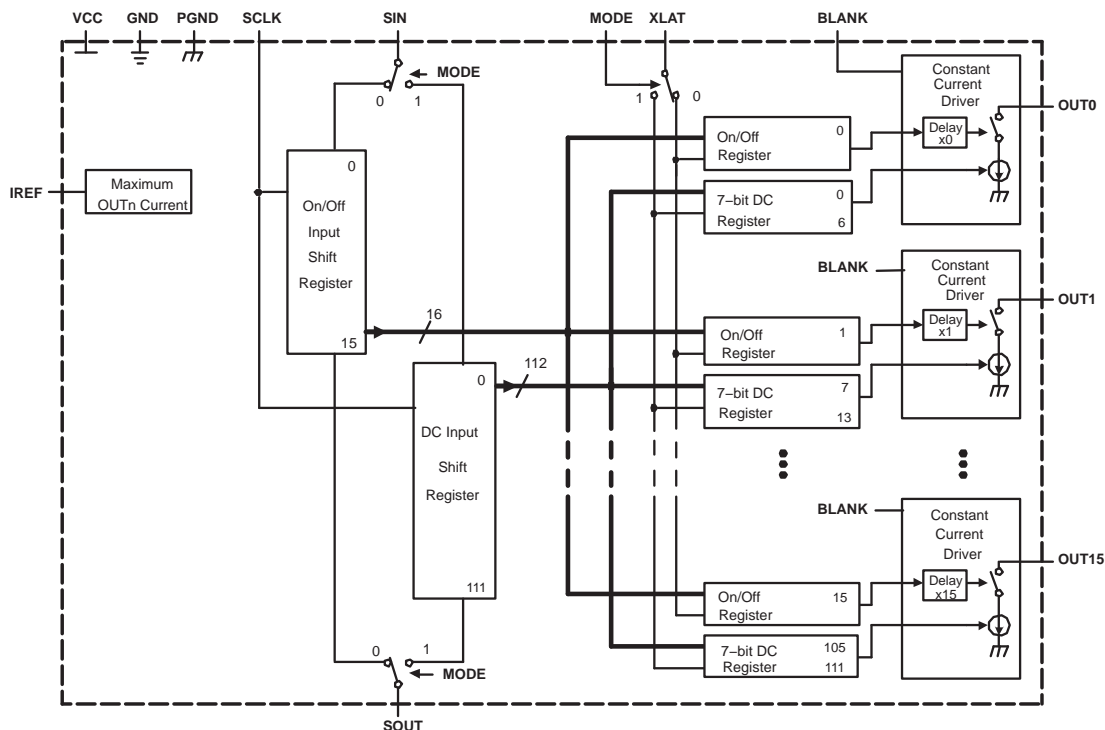

Figure 1. Functional Block Diagram

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION[1]

T_A	Package	Part Number [2]
−20 °C to 85 °C	4 mm x 4 mm, 32-pin HTSSOP	TLC5922DAP

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.
(2) The DAP package is available in tape and reel. Add R suffix (TLC5922DAPR) to order quantities of 2000 parts per reel.

ABSOLUTE MAXIMUM RATINGS [1] [2]

			TLC5922	UNIT
V_{CC}	Supply voltage[2]		−0.3 to 6	V
I_O	Output current (dc)	$I_{L(LC)}$	90	mA
V_I	Input voltage range[2]	$V_{(BLANK)}$, $V_{(XLAT)}$, $V_{(SCLK)}$, $V_{(SIN)}$, $V_{(MODE)}$	−0.3 to V_{CC} + 0.3	V
V_O	Output voltage range[2]	$V_{(SOUT)}$	−0.3 to V_{CC} + 0.3	V
		$V_{(OUT0)}$ – $V_{(OUT15)}$	−0.3 to 18	V
	ESD rating	HBM (JEDEC JESD22-A114, Human Body Model)	2	kV
		CDM (JEDEC JESD22-C101, Charged Device Model)	500	V
T_{stg}	Storage temperature range		−40 to 150	°C
	Continuous total power dissipation at (or below) T_A = 25°C		3.9	W
	Power dissipation rating at (or above) T_A = 25°C		31.4	mW/°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

PRINCIPLES OF OPERATION

Setting Maximum Channel Current

The maximum output current per channel is set by a single external resistor, $R_{(IREF)}$, which is placed between IREF and GND. The voltage on IREF is set by an internal band gap $V_{(IREF)}$ with a typical value of 1.24V. The maximum channel current is equivalent to the current flowing through $R_{(IREF)}$ multiplied by a factor of 40. The maximum output current can be calculated by Equation 1:

$$I_{MAX} = \frac{V_{IREF}}{R_{IREF}} \times 40$$

(1)

where:

V_{IREF} = 1.24V typ.

R_{IREF} = User selected external resistor (R_{IREF} should not be smaller than 600 Ω)

Figure 6 shows the maximum output current, $I_{O(LC)}$, versus $R_{(IREF)}$. In Figure 6, $R_{(IREF)}$ is the value of the resistor between IREF terminal to ground, and $I_{O(LC)}$ is the constant output current of OUT0,.....OUT15.
Figure 6. Reference Resistor vs Output Current

Setting Dot-Correction

The TLC5922 has the capability to fine adjust the current of each channel, OUT0 to OUT15 independently. This is also called dot correction. This feature is used to adjust the brightness deviations of LED connected to the output channels OUT0 to OUT15. Each of the 16 channels can be programmed with a 7-bit word. The channel output can be adjusted in 128 steps from 0% to 100% of the maximum output current I_{MAX}. Equation 2 determines the output current for each OUTn:

$$I_{Outn} = \frac{I_{MAX} \times DC_n}{127}$$

(2)

where:

I_{Max} = the maximum programmable current of each output

DC_n = the programmed dot-correction value for output n (DC_n = 0, 1, 2 ...127)

n = 0, 1, 2 ... 15

Dot-correction data are entered for all channels at the same time. The complete dot-correction data format consists of 16 x 7-bit words, which forms a 112-bit wide serial data packet. The channel data is put one after another. All data is clocked in with MSB first. Figure 7 shows the DC data format.
LSB								MSB
0		6	7			104	105	111
DC 0.0	• • •	DC 0.6	DC 1.0		• • •	DC 14.6	DC 15.0	• • •	DC 15.6
DC OUT0				DC OUT2 – DC OUT14		DC OUT15		

Figure 7. DC Data Format

MODE must be set to high to input data into the dot-correction register. The internal input shift register is then set to 112-bit width. After all serial data is clocked in, a rising edge of XLAT latches the data to the dot-correction register (Figure 10).

Output Enable

All OUTn channels of TLC5922 can switched off with one signal. When BLANK signal is set to high, all OUTn are disabled, regardless of On/Off status of each OUTn. When BLANK is set to low, all OUTn work under normal conditions.

Table 1. BLANK Signal Truth Table

BLANK	OUT0 - OUT15
LOW	Normal condition
HIGH	Disabled

Setting Channel On/Off Status

All OUTn channels of TLC5922 can be switched on or off independently. Each of the channels can be programmed with a 1-bit word. On/Off data are entered for all channels at the same time. The complete On/Off data format consists of 16 x 1-bit words, which form a 16-bit wide data packet. The channel data is put one after another. All data is clocked in with MSB first. Figure 8 shows the On/Off data format.

LSB															MSB
0															15
On/Off OUT0	On/Off OUT1	On/Off OUT2	On/Off OUT3	On/Off OUT4	On/Off OUT5	On/Off OUT6	On/Off OUT7	On/Off OUT8	On/Off OUT9	On/Off OUT10	On/Off OUT11	On/Off OUT12	On/Off OUT13	On/Off OUT14	On/Off OUT15
On/Off Data															

Figure 8. On/Off Data

MODE must be set to low to input On/Off data into the On/Off register. The internal input shift register is then set to 16-bit width. After all serial data is clocked in, a rising edge of XLAT, during BLANK = high, is used to latch data into the On/Off register. Figure 10 shows the On/Off data input timing chart.

Delay Between Outputs

The TLC5922 has graduated delay circuits between outputs. These delay circuits can be found in the constant current block of the device (see Figure 1). The fixed delay time is 20 ns (typical), OUT0 has no delay, OUT1 has 20-ns delay, OUT2 has 40-ns delay, etc. This delay prevents large inrush currents, which reduce power supply bypass capacitor requirements when the outputs turn on.

Product Folder Link(s): *TLC5922*

Serial Interface Data Transfer Rate

The TLC5922 includes a flexible serial interface, which can be connected to a microcontroller or digital signal processor. Only 3 pins are required to input data into the device. The rising edge of SCLK signal shifts the data from SIN pin to internal shift register. After all data is clocked in, a rising edge of XLAT latches the serial data to the internal registers. All data is clocked in with MSB first. Multiple TLC5922 devices can be cascaded by connecting SOUT pin of one device to the SIN pin of following device.
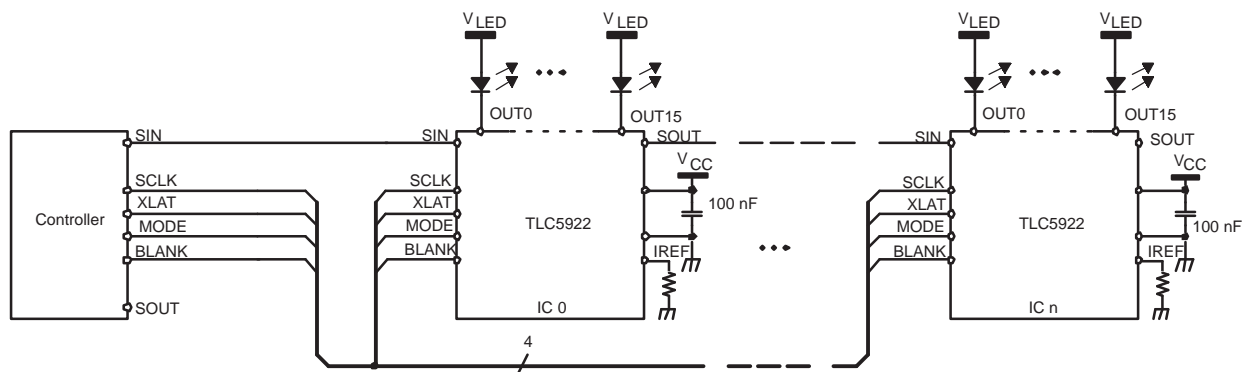

Figure 9. Cascading Devices

Figure 9 shows an example application with *n* cascaded TLC5922 devices connected to a controller. The maximum number of cascaded TLC5922 devices depends on the application system, and data transfer rate. Equation 3 calculates the minimum data input frequency needed.

$$f_{(SCLK)} = 112 \times f_{(update)} \times n \tag{3}$$

where:

f_(SCLK): The minimum data input frequency for SCLK and SIN.

f_(update): The update rate of the whole cascaded system.

n: The number of cascaded TLC5922 devices.

Operating Modes

The TLC5922 has different operating modes, depending on the MODE signal. Table 2 shows the available operating modes.

Table 2. TLC5922 Operating Modes Truth Table

MODE SIGNAL	INPUT SHIFT REGISTER	MODE
LOW	16 bit	On/Off Mode
HIGH	112 bit	Dot-Correction Data Input Mode

THERMAL INFORMATION

The DAP PowerPAD™ package incorporates an exposed thermal die pad that is designed to be attached directly to an external heat sink. When the thermal die pad is soldered directly to the printed circuit board (PCB), the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal die pad can be attached directly to a ground plane or special heat sink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, *PowerPAD Thermally Enhanced Package*, Texas Instruments Literature No. SLMA002 and Application Brief, *PowerPAD Made Easy*, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com. See Figure 1 for DAP package exposed thermal die pad dimensions.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DAP (R−PDSO−G32)   PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

        www.ti.com <http://www.ti.com>. Publication IPC−7351 is recommended for alternate designs.
   E.   Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
        contact their board assembly site for stencil design recommendations. Refer to IPC−7525 for other stencil recommendations.
   F.   Contact the board fabrication site for recommended soldermask tolerances.
