

TUSB217A USB 2.0 High-Speed Signal Conditioner With DCP and CDP Controllers

1 Features

- Wide supply voltage range: 2.3 - 6.5 V
- Ultra-low USB disconnect and shutdown power consumption
- Provides USB 2.0 high-speed signal conditioning
- Compatible with USB 2.0, OTG 2.0 and BC 1.2
- Support for low-speed, full-speed, high-speed signaling
- Integrated BC 1.2 Charging Downstream Port (CDP) and Dedicated Charging Port (DCP) controllers that dynamically changes per DCP/CDP pin
- Host/Device agnostic
- Supports up to 5-m cable length
 - Four selectable signal boost (edge boost along with DC boost) settings via external pull-down resistor values
 - Three selectable RX equalization settings via pull-up-or-down to compensate ISI jitter for high-loss applications
- Supports up to 10-m cable length with two TUSB217A devices
- Scalable solution - devices can be daisy chained for high loss applications
- RWB is pin compatible with TUSB211/212/214/216

3 Description

The TUSB217A is a third-generation USB 2.0 high-speed signal conditioner designed to compensate both AC loss (due to capacitive load) and DC loss (due to resistive loss) in the transmission channel.

The TUSB217A leverages a patented design to speed-up transition edges of USB 2.0 high-speed signal with an edge booster and increases static levels with a DC boost function. In addition, the TUSB217A includes a pre-equalization function to improve the receiver sensitivity and compensate the inter-symbol interference (ISI) jitter in application with longer cable length. USB low-speed and full-speed signal characteristics are unaffected by the TUSB217A.

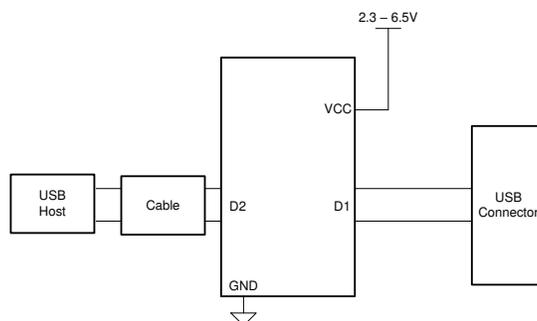

The TUSB217A improves signal quality without altering packet timing or adding propagation delay or latency.

The TUSB217A helps a system to pass the USB 2.0 high-speed near end eye compliance with a cable as long as 5 meters.

The TUSB217A is compatible with the USB On-The-Go (OTG) and battery charging (BC 1.2) protocols. The Integrated BC 1.2 battery charging controller can be enabled via a control pin.

PIN (RWB)		I/O	INTERNAL PULLUP/PULLDOWN	DESCRIPTION
NAME	NO. (RWB)			
BOOST	6	I	N/A	USB High-speed boost select via external pull down resistor. Both edge boost and DC boost are controlled by a single pin in non-I2C mode. In I2C mode edge boost and DC boost can be individually controlled. Sampled upon power up. Does not recognize real time adjustments. Auto selects BOOST LEVEL = 3 when left floating.
DCP/CDP	11	I	500 kΩ PU	DCP or CDP mode selection. Low=DCP and High=CDP TUSB217ARWB BC1.2 controller is always enabled.
RX_SEN ⁽²⁾ /ENA_HS	9	I/O	N/A	In I2C mode: Reserved for TI test purpose. In non-I2C mode: At reset: 3-level input signal RX_SEN. USB High-speed RX Equalization Setting to Compensate ISI Jitter H (pin is pulled high) – high RX equalization (high loss channel) M (pin is left floating) – medium RX equalization (medium loss channel) L (pin is pulled low) – low RX equalization (low loss channel) After reset: Output signal ENA_HS. Flag indicating that channel is in High-speed mode. Asserted upon: 1. Detection of USB-IF High-speed test fixture from an unconnected state followed by transmission of USB TEST_PACKET pattern. 2. Squelch detection following USB reset with a successful HS handshake [HS handshake is declared to be successful after single chirp J chirp K pair where each chirp is within 18 μs – 128 μs].

Table 6-1. Pin Functions (continued)

PIN (RWB)		I/O	INTERNAL PULLUP/PULLDOWN	DESCRIPTION
NAME	NO. (RWB)			
RSTN	5	I	500 kΩ PU 1.8 MΩ PD	Device disable/enable. Low – Device is at reset and in shutdown, and High - Normal operation. Recommend 0.1-μF external capacitor to GND to ensure clean power on reset if not driven. If the pin is driven, it must be held low until the supply voltage for the device reaches within specifications.
SCL ⁽¹⁾ /CD	4	I/O	When RSTN asserted there is a 500 kΩ PD	In I2C mode: I2C clock pin [I2C address = 0x2C]. Non I2C mode: After reset: Output CD. Flag indicating that a USB device is attached (connection detected). Asserted from an unconnected state upon detection of DP or DM pull-up resistor. De-asserted upon detection of disconnect.

- (1) Pull-up resistors for SDA and SCL pins in I²C mode should be R_{Pull-up} (depending on I²C bus voltage). If both SDA and SCL are pulled up at power-up the device enters into I²C mode.
- (2) Pull-down and pull-up resistors for RX_SEN pin must follow R_{RXSEN1} and R_{RXSEN2} resistor recommendations in non I²C mode.

8 Detailed Description

8.1 Overview

The TUSB217A is a USB High-Speed (HS) signal conditioner designed to compensate for ISI signal loss in a transmission channel. TUSB217A has a patented design for USB Low Speed (LS) and Full Speed (FS) signals. It does not alter the signal characteristics. HS signals are compensated. The design is compatible with USB On-The-Go (OTG) and Battery Charging (BC) specifications.

Programmable signal gain through an external resistor permits fine tuning device performance to optimize signals. This helps pass USB HS electrical compliance tests at the connector. Additional RX sensitivity, tuned by external pull-up resistor and pull-down resistor, allows to overcome attenuation in cables. The TUSB217A allows application in series to cover longer distances, or high loss transmission paths. A maximum of 4 devices can be daisy-chained.

8.3 Feature Description

8.3.1 High-speed Boost

The high-speed booster (combination of edge boost and DC boost) improves the eye width for USB2.0 high-speed signals. It is direction independent and by that is compatible to OTG systems. The BOOST pin is configuring the booster strength with different values of pull down resistors to set 4 levels of boosts, alternatively the boost level can be set via I2C register according to [Section 8.4.6](#). Internal circuitry of the signal conditioner reduces possible overshoot.

8.3.2 RX Sensitivity

The RX_SEN pin is a tri-level pin. It is used to set the equalization gain of the device according to system channel inter-symbol interference (ISI) loss. RX equalization can be increased to compensate for the higher ISI loss of the channel for example due to a long cable.

8.4 Device Functional Modes

8.4.1 Low-speed (LS) Mode

TUSB217A automatically detects a LS connection and does not enable signal compensation. CD pin is asserted high but ENA_HS will be low.

8.4.2 Full-speed (FS) Mode

TUSB217A automatically detects a FS connection and does not enable signal compensation. CD pin is asserted high but ENA_HS will be low

8.4.3 High-speed (HS) Mode

TUSB217A automatically detects a HS connection and will enable signal compensation as determined by the configuration of the RX_SEN pin and the external pull down resistance on its BOOST pin.

CD pin and ENA_HS pin are asserted high when high-speed boost is active.

8.4.4 High-speed Downstream Port Electrical Compliance Test Mode

TUSB217A will detect HS compliance test fixture and enter downstream port high-speed eye diagram test mode. CD pin will be low and ENA_HS pin is asserted high when TUSB217A is in HS eye compliance test mode.

If RSTN pin is asserted low and de-asserted high while TUSB217A is operating in HS functional mode, TUSB217A may transition to HS eye compliance test mode and CD asserts low and ENA_HS remains high. When this occurs signal compensation is enabled.

8.4.5 Shutdown Mode

TUSB217A can be disabled when its RSTN pin is asserted low. DP, DM traces are continuous through the device in shutdown mode. The USB channel is still fully operational, but there is neither signal compensation, nor any indication from the CD pin as to the status of the channel.

Table 8-1. CD and ENA_HS Pins in Different Modes

MODE	CD	ENA_HS
Low-speed	HIGH	LOW
Full-speed	HIGH	LOW
High-speed	HIGH	HIGH
High-speed downstream port electrical test	LOW	HIGH
Shutdown	LOW	LOW

8.4.6 I²C Mode

TUSB217A supports 100 KHz I2C for device configuration, status read back and test purposes. For detail electrical and functional specifications refer to I2C Bus Specification 2.1, 2001 – STANDARD MODE. This controller is enabled after SCL and SDA pins are sampled high shortly after return from shutdown. In this mode, the CSR can be accessed by I2C read/write transaction to 7-bit slave address 0x2C. It is advised to set CFG_ACTIVE bit before changing values. This halts the FSM, and reset it after all changes are made. This ensure proper startup into high-speed mode.

8.4.7 BC 1.2 Battery Charging Controller

Battery charging controller feature is always enabled in TUSB217ARWB and supports both CDP charging downstream port functionality and DCP dedicated charging port functionality depending on DCP/CDP pin. When DCP/CDP pin is high the BC 1.2 controller supports CDP mode and when DCP/CDP pin is low BC 1.2 controller supports DCP mode. DCP/CDP pin can be dynamically controlled. When host or hub is disabled DCP/CDP pin can be set low to support DCP mode and when host or hub is enabled DCP/CDP pin can be set to high to support CDP. Downstream VBUS should be toggled after the DCP/CDP pin change so BC 1.2 handshake starts over to indicate charging mode change.

DCP/CDP pin has an internal pull up resistor. When DCP/CDP pin is left unconnected the BC 1.2 controller will be in CDP mode.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

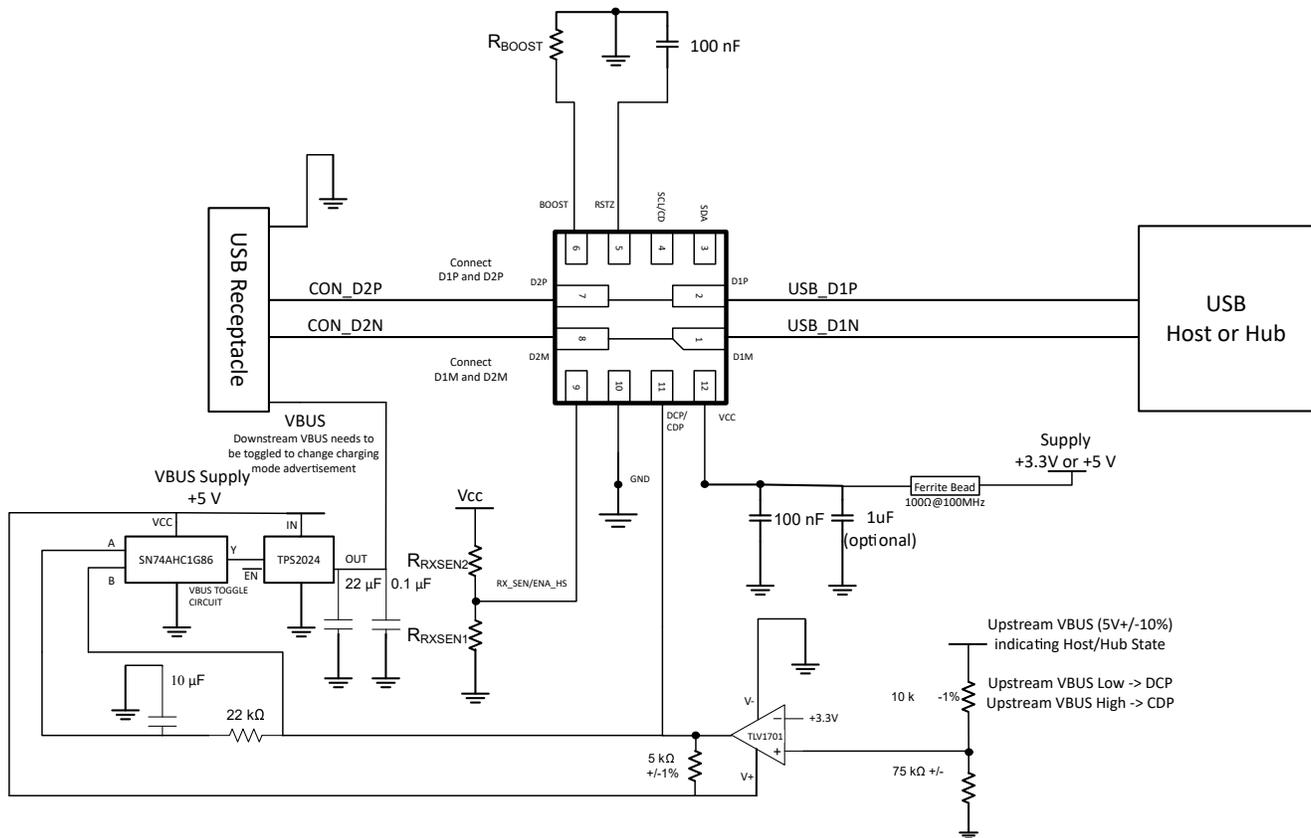

9.1 Application Information

The purpose of the TUSB217A is to re-store the signal integrity of a USB High-speed channel up to the USB connector. The loss in signal quality stems from reduced channel bandwidth due to high loss PCB trace and other components that contribute a capacitive load. This can cause the channel to fail the USB near end eye mask. Proper use of the TUSB217A can help to pass this eye mask.

A secondary purpose is to use the CD pin of the TUSB217A to control other blocks on the customer platform, if so desired.

9.2 Typical Application

A typical application for TUSB217A with dynamic mode change between DCP and CDP is shown in [Figure 9-1](#). BC 1.2 controller mode will be based on host/hub active state in this application. When host/hub is not active the controller will be in DCP mode and when the host/hub is active the controller will be in CDP mode. Downstream VBUS needs to be toggled by the power controller to change advertisement and for portable device to re-detect the BC 1.2 controller charging mode. In this setup, D2P and D2M face the USB connector while D1P and D1M face the USB host. The orientation may be reversed [that is, D2 faces transceiver and D1 faces connector]

9.2.1 Design Requirements

TUSB217A requires a valid reset signal as described in the *power supply recommendations* section. The capacitor at RSTN pin is not required if a micro controller drives the RSTN pin according to recommendations.

For this design example, use the parameters shown in [Table 9-1](#), [Table 9-2](#) and [Table 9-3](#)

Table 9-1. Design Parameters for 5-V Supply With High Loss System

PARAMETER				VALUE ⁽¹⁾
V _{CC}				5 V ±10%
I ² C support required in system (Yes/No)				No

	Do Not Install (DNI)	Do Not Install (DNI)	Medium
	37.5 kΩ ⁽²⁾	12.5 kΩ	High

- (1) These parameters are starting values for a low to medium loss system. Further tuning might be required based on specific host and/or device as well as cable length and loss profile. These settings are not specific to a 2.3V-4.3V supply system could be applicable to 5V supply system as well.
- (2) This resistor is needed for a VBAT supply (2.3V - 4.3V) to divide the voltage down so the RX_SEN pin voltage does not exceed 5.0V

9.2.2 Detailed Design Procedure

The ideal BOOST setting is dependent upon the signal chain loss characteristics of the target platform. The recommendation is to start with BOOST level 0, and then increment to BOOST level 1, and so on. Same applies to the RX sensitivity setting where it is recommended to plan for the required pads or connections to change boost settings, but to start with RX sensitivity level Low.

In order for the TUSB217A to recognize any change to the BOOST setting, the RSTN pin must be toggled. This is because the BOOST pin is latched on power up and the pin is ignored thereafter.

Note

The TUSB217A compensates for extra attenuation in the signal path according to the configuration of the RX_SEN pin. This maximum recommended voltage for this pin is 5 V when selecting the highest RX sensitivity level.

Placement of the device is also dependent on the application goal. [Table 9-4](#) summarizes our recommendations.

Table 9-4. Platform Placement Guideline

PLATFORM GOAL	SUGGESTED TUSB217A PLACEMENT
Pass USB Near End Mask at the receptacle	Close to measurement point (connector)
Pass USB Far End Eye Mask at the plug	Close to USB PHY
Cascade multiple TUSB217As to improve device enumeration	Midway between each USB interconnect

Table 9-5. Table of Recommended Settings

BOOST and RX_SEN settings ⁽¹⁾ for channel loss		
Pre-channel cable length (Between USB PHY and TUSB217A)	BOOST	RX_SEN
0-3 meter	Level 0	Medium or High
2-5 meter	Level 1	Medium or High
Post-channel cable length (Between TUSB217A and inter-connect)	BOOST	RX_SEN
0-2 meter	Level 0	Medium or High
1-4 meter	Level 1	Medium or High

- (1) These parameters are starting values for different cable lengths. Further tuning might be required based on specific host and/or device as well as cable length and loss profile.

9.2.2.1 Test Procedure to Construct USB High-speed Eye Diagram

Note

USB-IF certification tests for High-speed eye masks require the *mandated use* of the USB-IF developed test fixtures. These test fixtures do not require the use of oscilloscope probes. Instead they use SMA cables. More information can be found at the USB-IF Compliance Updates Page. It is located under the *Electrical Specifications* section, ID 86 dated March 2013.

The following procedure must be followed before using any oscilloscope compliance software to construct a USB High-speed Eye Mask:

9.2.2.1.1 For a Host Side Application

1. Configure the TUSB217A to the desired BOOST setting
2. Power on (or toggle the RSTN pin if already powered on) the TUSB217A
3. Using SMA cables, connect the oscilloscope and the USB-IF host-side test fixture to the TUSB217A
4. Enable the host to transmit USB TEST_PACKET
5. Execute the oscilloscope USB compliance software.
6. Repeat the above steps in order to re-test TUSB217A with a different BOOST setting (must reset to change)

9.2.2.1.2 For a Device Side Application

1. Configure the TUSB217A to the desired BOOST setting
2. Power on (or toggle the RSTN pin if already powered on) the TUSB217A
3. Connect a USB host, the USB-IF device-side test fixture, and USB device to the TUSB217A. Ensure that the USB-IF device test fixture is configured to the 'INIT' position
4. Allow the host to enumerate the device
5. Enable the device to transmit USB TEST_PACKET
6. Using SMA cables, connect the oscilloscope to the USB-IF device-side test fixture and ensure that the device-side test fixture is configured to the 'TEST' position.
7. Execute the oscilloscope USB compliance software.
8. Repeat the above steps in order to re-test TUSB217A with a different BOOST setting (must reset to change)

10 Power Supply Recommendations

On power up, the interaction of the RSTN pin and power on ramp could result in digital circuits not being set correctly. The device should not be enabled until the power on ramp has settled to minimum recommended supply voltage or higher to ensure a correct power on reset of the digital circuitry. If RSTN cannot be held low by microcontroller or other circuitry until the power on ramp has settled, then an external capacitor from the RSTN pin to GND is required to hold the device in the low power reset state.

The RC time constant should be larger than five times of the power on ramp time (0 to V_{CC}). With a typical internal pullup resistance of 500 k Ω , the recommended minimum external capacitance is calculated as:

$$[\text{Ramp Time} \times 5] \div [500 \text{ k}\Omega] \tag{1}$$

11 Layout

11.1 Layout Guidelines

Although the land pattern has matched trace width to pad width, optimal impedance control is based on the user's own PCB stack-up. The recommendation is to maintain 90 Ω differential routing underneath the device.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.
