

3 mΩ reverse battery protection switch

Datasheet — production data

Features

Max supply voltage	V_{CC}	-16 to 41 V
Operating voltage range	V_{CC}	-16 to 28 V
On-state resistance	R_{ON}	3 mΩ

- General
 - Optimized electromagnetic emissions
 - Very low electromagnetic susceptibility
 - Compliant with European directive 2002/95/EC
- Protections
 - Automatic switch off in case of negative input voltage
 - Electrostatic discharge protection

Application

- Reverse battery protection of an electronic control unit

Description

The VN5R003H-E is a device made using STMicroelectronics® VIPower® technology. It is intended for providing reverse battery protection to an electronic module.

This device has two power pins (Drain and Source) and a control pin $\overline{IN}$. If the $\overline{IN}$ voltage versus Drain is negative the device is turned on.

A negative voltage of Drain pin versus $\overline{IN}$ automatically turns off the device. When $\overline{IN}$ is left open, device is in OFF-state and behaves like a power diode between Source and Drain pins.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_S	Source power terminal DC voltage (reverse battery mode)	-16 to 41	V
I_S, I_D	Source or Drain current	60	A
$-I_S, -I_D$	Reverse currents	60	A
E_{MAX}	Inductive clamp energy $L = 2 \text{ mH}$, $V_D = 0 \text{ V}$, $\overline{IN}$ open, $I_S < 0$, $T_{jstart} = 25^\circ\text{C}$	0.9	J
V_{ESD}	Electrostatic discharge (Human Body Model: $R = 1.5 \text{ K}\Omega$; $C = 100 \text{ pF}$) - All terminals	5000	V
V_{ESD}	Charge device model (CDM-AEC-Q100-011)	1000	V

Class	Contents
C	All functions of the device are performed as designed after exposure to disturbance.
E	One or more functions of the device are not performed as designed after exposure to disturbance and cannot be returned to proper operation without replacing the device.

3 Application information

[Figure 5](#) shows the solution for systems supplied directly from the battery. If the system goes into *Stand-by* mode, the transistor T1 is switched off by the microcontroller with zero quiescent current. System is still supplied through the PowerMOS body diode.

Figure 5. Battery supplied systems

[Figure 6](#) refers to a solution for systems supplied after the ignition switch. Low quiescent currents are not strictly required, so resistor R1 can be directly connected to ground.
