

FEATURES

- SO Package with Standard Pinout
- Supply Current per Amplifier: 17 μ A Max
- Offset Voltage: 70 μ V Max
- Offset Current: 250pA Max
- Input Bias Current: 5nA Max
- Voltage Noise: 0.9 μ V_{P-P}, 0.1Hz to 10Hz
- Current Noise: 1.5pA_{P-P}, 0.1Hz to 10Hz
- Offset Voltage Drift: 0.5 μ V/ $^{\circ}$ C
- Gain Bandwidth Product: 85kHz
- Slew Rate: 0.04V/ μ s
- Single Supply Operation
 - Input Voltage Range Includes Ground
 - Output Swings to Ground while Sinking Current
 - No Pull-Down Resistors Needed
- Output Sources and Sinks 5mA Load Current

APPLICATIONS

- Battery- or Solar-Powered Systems
 - Portable Instrumentation
 - Remote Sensor Amplifier
 - Satellite Circuitry
- Micropower Sample-and-Hold
- Thermocouple Amplifier
- Micropower Filters

 LT and LTC are registered trademarks of Linear Technology Corporation.

DESCRIPTION

The LT®2178 is a micropower dual op amp in a surface mount standard 8-pin configuration, the LT2179 is a micropower quad op amp offered in a surface mount 14-pin package. Both devices are optimized for single supply operation at 5V. Specifications are also provided at \pm 15V supply.

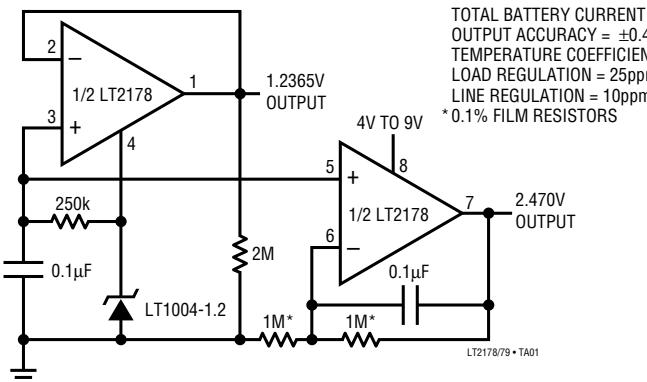

The extremely low supply current is combined with true precision specifications: offset voltage is 30 μ V and offset current is 50pA. Both offset parameters have low drift with temperature. The 1.5pA_{P-P} current noise and picoampere offset current permit the use of megohm level source resistors without introducing serious errors. Voltage noise, at 0.9 μ V_{P-P}, is remarkably low considering the low supply current.

The LT2178/LT2179 can be operated from a single supply (as low as one lithium-cell or two NiCd batteries). The input range goes below ground. The all-NPN output stage swings to within a few millivolts of ground while sinking current. No power consuming pull down resistors are needed.

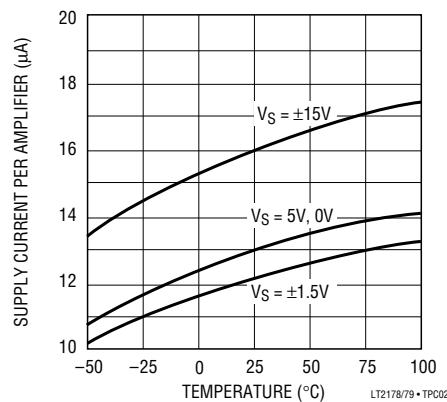

For surface mount applications where three times higher supply current is acceptable, the micropower LT1077 single, LT2078 dual and LT2079 quad are recommended. The LT1077/LT2078/LT2079 have significantly higher bandwidth, slew rate, lower voltage noise and better output drive capability. For applications requiring DIP packages refer to the LT1178/LT1179.

TYPICAL APPLICATION

Self-Buffered, Dual Output, Micropower Reference

Supply Current vs Temperature

The ● denotes specifications which apply over the full operating temperature range.

Note 1: Typical parameters are defined as the 60% yield of parameter distributions of individual amplifiers, i.e., out of 100 LT2179s (or 100 LT2178s) typically 240 op amps (or 120) will be better than the indicated specification.

Note 2: This parameter is tested on a sample basis only. All noise parameters are tested with $V_S = \pm 2.5V, V_O = 0V$.

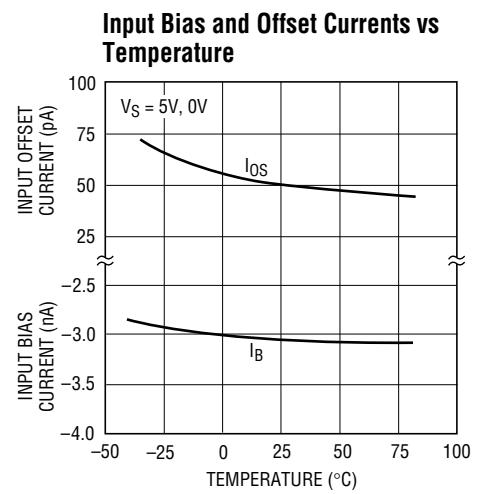

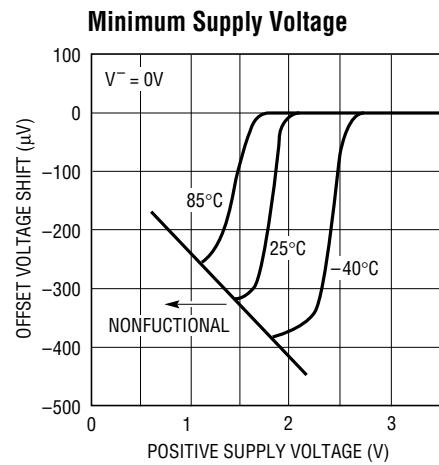

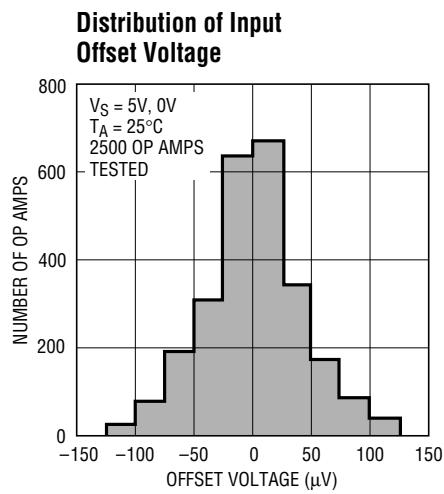

Note 3: This parameter is guaranteed by design and is not tested.

Note 4: Power supply rejection ratio is measured at the minimum supply voltage. The op amps actually work at 1.7V supply but with a typical offset skew of $-300\mu V$.

Note 5: This parameter is not 100% tested.

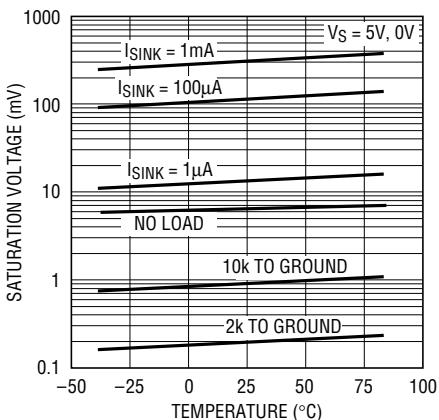

Note 6: During testing at $-40^\circ C$, the 5V power supply turn-on time is less than 0.5s.

Note 7: The LT2178C/LT2179C are designed, characterized and expected to meet the industrial temperature limits, but are not tested at $-40^\circ C$ and $85^\circ C$. I-grade parts are guaranteed.
