Audio Click-Pop Suppressor

General Description

The MAX9890 provides click-and-pop suppression for devices such as CODECs with test integrated headphone amplifiers that lack a clickless/popless startup/power-up or shutdown/power-down. The device controls the ramping of the DC bias voltage on the output-coupling capacitors and the application of the audio signal to ensure that no audible transients are present at the headphones. The MAX9890A features a 200ms startup time for use with up to 100 μ F coupling capacitors. The MAX9890B features a 330ms startup time for use with greater than 100 μ F coupling capacitors.

The MAX9890 consumes 14 μ A of supply current and 0.001 μ A in shutdown, while contributing less than 0.003% THD+N into a 32 Ω load. ESD (Human Body Model) protection circuitry on the outputs protect the MAX9890 and devices further up the signal chain from ESD strikes up to ±8kV.

The MAX9890 is available in a miniature ($1.5mm \times 1.5mm \times 0.6mm$) 9-bump chip-scale package (UCSPTM), as well as an 8-pin TDFN package ($3mm \times 3mm \times 0.8mm$), and is specified for operation over the -40°C to +85°C extended temperature range.

PDAs

Cell Phones

Applications

- High-End Notebook Audio
 - Portable DVD Players
- Portable MP3 Players

Simplified Block Diagram

UCSP is a trademark of Maxim Integrated Products, Inc.

Features

- 36dB Click-Pop Suppression
- 2.7V to 5.5V Single-Supply Operation
- Clickless/Popless Startup/Power-Up and Shutdown/Power-Down
- 0.001µA Low-Power Shutdown Mode
- THD+N < 0.003% Into 32Ω
- ±8kV ESD Protected Outputs (Human Body Model)
- Requires Only One 0.1µF Capacitor to Complete the Circuit
- Low 14µA Supply Current
- Tiny Packaging
 - 9-Bump UCSP (1.5mm x 1.5mm x 0.6mm)
 - 8-Pin TDFN (3mm x 3mm x 0.8mm)

Ordering Information

PART	TEMP RANGE	PIN- PACKAGE	TOP MARK
MAX9890AEBL+T	-40°C to +85°C	9 UCSP-9	ADV
MAX9890AETA	-40°C to +85°C	8 TDFN-EP**	AHA
MAX9890BEBL+T	-40°C to +85°C	9 UCSP-9	ADW
MAX9890BETA	-40°C to +85°C	8 TDFN-EP**	AHB
MAX9890BETA/V+	-40°C to +85°C	8 TDFN-EP**	BRQ

**EP = Exposed pad.

+ Denotes a lead(Pb)-free/RoHS-compliant package.

T = Tape and reel.

/V denotes an automotive qualified part that conforms to AEC-Q100.

Pin Description

PIN/BUMP		NAME	FUNCTION	
TDFN	UCSP	NAME	FUNCTION	
1	C2	V _{CC}	Power Supply. V _{CC} accepts 2.7V to 5.5V input supply. Bypass VCC to GND with a 1 μ F capacitor.	
2	C1	SHDN	Active-Low Shutdown. Connect \overline{SHDN} to GND to enter a 0.1µA shutdown mode. Connect \overline{SHDN} to V_{CC} for normal operation.	
3	B1	INL	_eft-Channel Audio Input. Connect to output of headphone amplifier.	
4	A1	OUTL	Left-Channel Audio Output. AC couple to headphone.	
5	A2	GND	Ground	
6	A3	OUTR	Right-Channel Audio Output. AC couple to headphone.	
7	B3	INR	Right-Channel Audio Input. Connect to output of headphone amplifier.	
8 C3 CEXT		CEXT	External Capacitor. Connect a 0.1µF capacitor from CEXT to GND.	

Detailed Description

The MAX9890 provides click-and-pop suppression for single-supply devices such as CODECs and other headphone amplifiers that do not have click-and-pop suppression. Single-supply audio amplifier outputs have a DC bias voltage, V_{CC} / 2, and require large output-coupling capacitors to block the DC voltage from the speaker. During startup or shutdown, the DC bias voltage is quickly raised or lowered (Figure 1), resulting in an audible transient through the headphone load. The MAX9890 prevents the audible transient by slowly ramping the DC bias in an S-shaped waveform (Figure 2), suppressing the large transient at the output of the coupling capacitor. The S-shaped waveform shapes the frequency spectrum, minimizing the amount of audible components present at the output.

Internal switches couple the inputs to the outputs after the coupling capacitors have fully charged to the input common-mode bias voltage. When power is removed or the device is put into shutdown, the internal switches in the MAX9890 immediately disconnect the output and slowly discharge the coupling capacitors through $220k\Omega$ resistors.

The MAX9890 has an undervoltage lockout (UVLO) that prevents device operation when V_{CC} is below the power-down threshold (2.5V, typ). The MAX9890 features ±8kV ESD (Human Body Model) protection on the audio outputs.

Startup

The MAX9890 monitors V_{CC} and SHDN. The UVLO holds the device off when V_{CC} is below the power-down threshold (V_{UVLO}) or SHDN is held low. The device needs both

 V_{CC} above the power-down threshold and \overline{SHDN} = high for the part to start up. Once the supply voltage is above the power-down threshold and \overline{SHDN} is high, the device charges the coupling capacitors to the input DC bias voltage using CEXT to control the ramp. After the DC bias ramp, the internal switches close, coupling the audio input to the output. The MAX9890 provides click-pop suppression even if the output blocking capacitors are already partially or fully charged.

The MAX9890A features a 200ms switch turn-on time, enabling the use of up to 100μ F coupling capacitors at the output for applications requiring only a limited low-frequency response and a rapid turn-on time. The MAX9890B features a 330ms switch turn-on time, enabling the use of >100 μ F coupling capacitors at the output for extended low-frequency response applications. For optional click-pop suppression, mute the audio signal until after the turn-on time has elapsed.

The internal switches stay closed as long as V_{CC} is above the power-down threshold voltage and \overline{SHDN} is high. Figures 1 and 2 show typical startup/power-up sequences with and without click-pop suppression.

Shutdown

If the supply voltage falls below the UVLO threshold or if SHDN is driven low, the device enters low-power shutdown mode. In low-power shutdown mode, quiescent current reduces to 0.001μ A. The switches are immediately turned off and $220k\Omega$ resistors slowly bleed the charge off the coupling capacitors. Figures 3 and 4 show typical shutdown/power-down sequences with and without click-pop suppression. For optimal click-pop performance, mute the audio signal before shutting down the MAX9890.

Audio Click-Pop Suppressor

Figure 1. Startup/Power-Up Sequence Without Click-Pop Suppression

Figure 3. Shutdown/Power-Down Sequence Without Click-Pop Suppression

Switches

The MAX9890's internal switches connect the input to the output after the coupling capacitors are fully charged. The MAX9890A holds the switches open for 200ms and is ideal for coupling capacitors less than 100 μ F. The MAX9890B has a longer turn-on time of 330ms and is

Figure 2. Startup/Power-Up Sequence With Click-Pop Suppression

Figure 4. Shutdown/Power-Down Sequence With Click-Pop Suppression

ideal with larger coupling capacitors less than 220µF. The internal switches have a low on-resistance (R_{ON} = 0.5Ω) and on-resistance flatness (R_{FLAT(ON)} = 2mΩ) minimizing total harmonic distortion plus noise (THD+N). The relationship below shows the contribution to THD+N through the switch, due to on-resistance and on-resistance flat-

Figure 5. FFT for PSRR

ness (on-resistance flatness is defined as the difference between the maximum and minimum values of on-resistance measured over the specific analog-signal range).

$$THD_{MAXIMUM} = \frac{R_{FLAT(ON)}}{4R_{LOAD}} \times 100\%$$

Power-Supply Rejection Ratio (PSRR)

PSRR is the measurement of AC power-supply ripple or noise that couples to the output. Variations in supply voltage corrupt the audio signal, due to changes in the R_{ON} value by supply modulation. The FFT shown in Figure 5 was taken with a 19kHz $1V_{P-P}$ sine wave onto the 5V DC supply voltage, and a 20kHz $1V_{P-P}$ sine wave applied at IN_ with a 32 Ω load is shown in Figure 6. The MAX9890 maintains a -100dB (typ) PSRR across the supply voltage range eliminating any corruption of the audio signal from supply variations. Therefore, with a zero audio signal, the R_{ON} variation due to supply voltage ripple does not contribute to any output signal modulation.

Low-Frequency Response

In addition to the cost and size disadvantages of the output-coupling capacitors, these capacitors limit the amplifier's low-frequency response and can distort the audio signal.

Figure 6. PSRR Test Circuit

The impedance of a headphone or speaker load and the output-coupling capacitor form a highpass filter with the -3dB point set by:

$$f_{-3dB} = \frac{1}{2\pi R_L C_{OUT}}$$

where R_L is the headphone impedance and C_{OUT} is the output-coupling capacitor value. The highpass filter is required by conventional single-ended, single powersupply headphone drivers to block the midrail DC bias component of the audio signal from the headphones. The drawback to the filter is that it can attenuate lowfrequency signals. Larger values of C_{OUT} reduce this effect but result in physically larger, more expensive capacitors. Figure 7 shows the relationship between the size of C_{OUT} and the resulting low-frequency attenuation. Note that the -3dB point for a 16 Ω headphone with a 100µF blocking capacitor is 100Hz, well within the normal audio band, resulting in low-frequency attenuation of the reproduced signal.

The MAX9890A and MAX9890B have different turn-on times to accommodate different size output-coupling capacitors (see Table 1). Using a capacitor smaller than the specified maximum allowed does not degrade clickpop suppression. Therefore, capacitors less than 100μ F can be used with the A or B version devices.

Figure 7. Low-Frequency Attenuation for Common DC-Blocking Capacitor Values

External Capacitor (CCEXT)

The external click-pop suppression capacitor at CEXT serves a dual purpose. On power-up, C_{CEXT} is charged by an internal current source and is used to slowly ramp up the external coupling capacitors. When the device is powered down, C_{CEXT} powers the internal circuitry used to drain the external coupling capacitors. A 0.1μ F capacitor between CEXT and GND provides clickless/ popless operation with coupling capacitors for both the MAX9890A and MAX9890B, even with the rapid removal of supply voltage.

Applications Information

Layout

Good layout improves performance by decreasing the amount of stray capacitance and noise. To decrease stray capacitance, minimize PC board trace lengths and resistor leads, and place external components as close to the device as possible.

Power Supply and Bypassing

The excellent PSRR of the MAX9890 allows it to operate from noisy power supplies. In most applications, a $0.1\mu F$ capacitor from V_{CC} to GND is sufficient. This bypass capacitor should be placed close to $V_{CC}.$
