

Double channel high-side driver with analog current sense for automotive applications

Datasheet - production data

Features

Max transient supply voltage	V_{CC}	41 V
Operating voltage range	V_{CC}	4.5 to 28V
Typ on-state resistance (per ch.)	R_{ON}	8 mΩ
Current limitation (typ)	I_{LIMH}	76 A
Off-state supply current	I_S	2 μA ⁽¹⁾

1. Typical value with all loads connected.

- General:
 - Inrush current active management by power limitation
 - Very low standby current
 - 3.0V CMOS compatible input
 - Optimized electromagnetic emission
 - Very low electromagnetic susceptibility
 - Compliant with European directive 2002/95/EC
 - Proportional load current sense
 - High current sense precision for wide range current
 - Very low current sense leakage
- Diagnostic functions:
 - Off-state open-load detection
 - Current sense disable
 - Thermal shutdown indication
 - Output short to V_{CC} detection
 - Overload and short to ground (power limitation) indication

- Protection:
 - Undervoltage shutdown
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients
 - Protection against loss of ground and loss of V_{CC}
 - Thermal shut down
 - Reverse battery protection with self switch of the Power MOS

Applications

- All types of resistive, inductive and capacitive loads

Description

The VND5E008AY-E is a device made using STMicroelectronics® VIPower® MO-5 technology. It is intended for driving resistive or inductive loads with one side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes.

This device integrates an analog current sense which delivers a current proportional to the load current when CS_DIS high leads the current sense pin in high impedance.

Fault conditions such as overload, overtemperature or open-load are reported via the current sense pin

Output current limitation protects the device in overload condition. In case of long overload duration, the device limits the dissipated power to safe level up to thermal shutdown intervention. Thermal shutdown with automatic restart allows the device to recover normal operation as soon as fault condition disappears.

V_{DEMAG}	Turn-off output voltage clamp	$I_{OUT} = 2 \text{ A}; V_{IN} = 0; L = 6 \text{ mH}$	V_{CC-29}	V_{CC-32}	V_{CC-36}	V
V_{ON}	Output voltage drop limitation	$I_{OUT} = 0.4 \text{ A}; T_j = -40 \text{ °C...}150 \text{ °C}$ (see Figure 10)		25		mV

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

Table 10. Logic input

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit

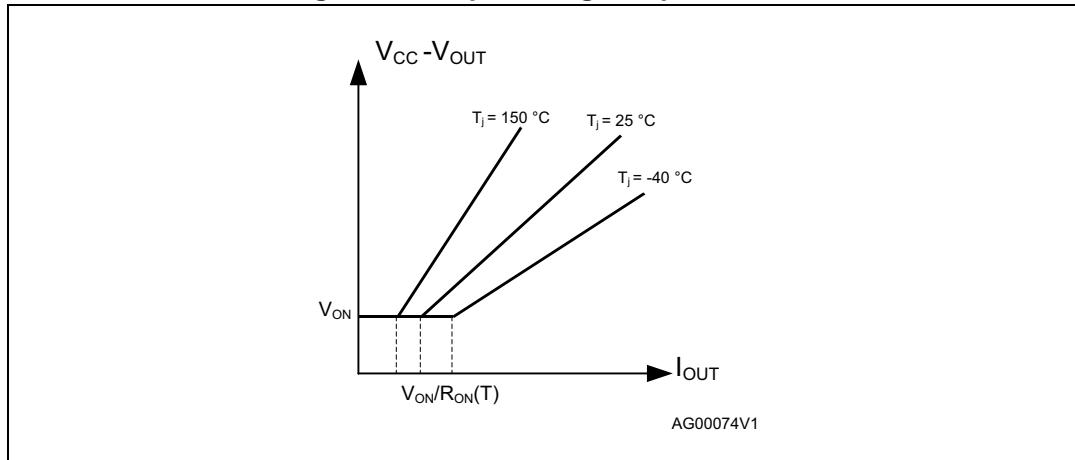

Figure 10. Output voltage drop limitation

Table 12. Electrical transient requirements (part 1)

ISO 7637-2: 2004(E) Test pulse	Test levels ⁽¹⁾		Number of pulses or test times	Burst cycle/pulse repetition time		Delays and impedance
	III	IV				
1	-75 V	-100 V	5000 pulses	0.5 s	5 s	2 ms, 10 Ω
2a	+37 V	+50 V	5000 pulses	0.2 s	5 s	50 μs, 2 Ω
3a	-100 V	-150 V	1h	90 ms	100 ms	0.1 μs, 50 Ω
3b	+75 V	+100 V	1h	90 ms	100 ms	0.1 μs, 50 Ω
4	-6 V	-7 V	1 pulse			100 ms, 0.01 Ω
5b ⁽²⁾	+65 V	+87 V	1 pulse			400 ms, 2 Ω

1. The above test levels must be considered referred to $V_{CC} = 13.5$ V except for pulse 5b.
2. Valid in case of external load dump clamp: 40V maximum referred to ground. The protection strategy allows PowerMOS to be cyclically switched on during load dump, so distributing the load dump energy along the time and to transfer a part of it to the load.

Table 13. Electrical transient requirements (part 2)

ISO 7637-2: 2004(E) Test pulse	Test level results ⁽¹⁾	
	III	IV
1	C	C
2a	C	C
3a	C	C
3b	C	C
4	C	C
5b ⁽²⁾⁽³⁾	C	C

1. The above test levels must be considered referred to $V_{CC} = 13.5$ V except for pulse 5b.
2. Valid in case of external load dump clamp: 40V maximum referred to ground. The protection strategy allows PowerMOS to be cyclically switched on during load dump, so distributing the load dump energy along the time and to transfer a part of it to the load.
3. Suppressed load dump (pulse 5b) is withheld with a minimum load connected as specified in [Table 3: Absolute maximum ratings](#).

Table 14. Electrical transient requirements (part 3)

Class	Contents
C	All functions of the device are performed as designed after exposure to disturbance.
E	One or more functions of the device are not performed as designed after exposure to disturbance and cannot be returned to proper operation without replacing the

3 Application information

Figure 32. Application schematic

3.1 Load dump protection

D_{Id} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the V_{CCPK} max rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

3.2 MCU I/Os protection

When negative transients are present on the V_{CC} line, the control pin is pulled negative to approximately -1.5 V. ST suggests to insert a resistor (R_{prot}) in line to prevent the microcontroller I/O pins from latching-up.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation 1:

$$-V_{CCpeak} / I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -1.5$ V; $I_{latchup} \geq 20$ mA; $V_{OH\mu C} \geq 4.5$ V
 $75 \Omega \leq R_{prot} \leq 240 \text{ k}\Omega$.

Recommended values: $R_{prot} = 10 \text{ k}\Omega$, $C_{EXT} = 10 \text{ nF}$.

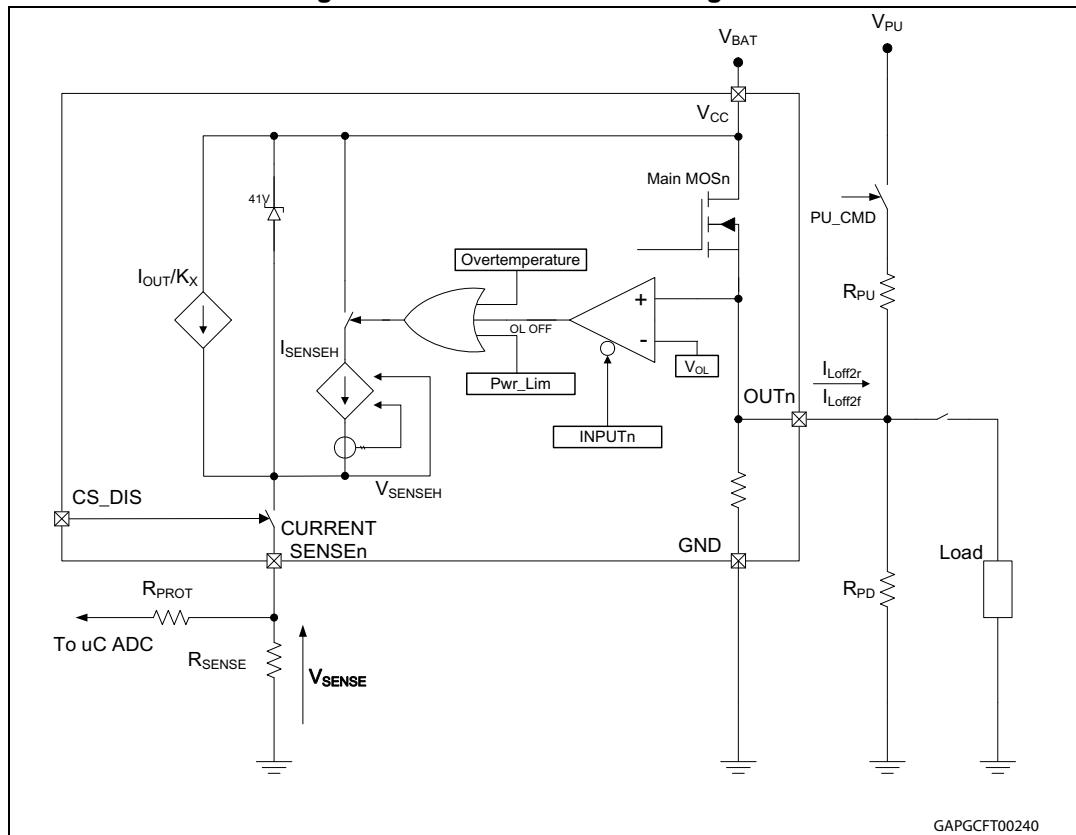

3.3 Current sense and diagnostic

The current sense pin performs a double function (see [Figure 33: Current sense and diagnostic](#)):

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load one according to a known ratio K_X .
The current I_{SENSE} can be easily converted to a voltage V_{SENSE} by means of an external resistor R_{SENSE} . Linearity between I_{OUT} and V_{SENSE} is ensured up to 5 V minimum (see parameter V_{SENSE} in [Table 7: Current sense \(8 V < VCC < 18 V\)](#)). The current sense accuracy depends on the output current (refer to current sense electrical characteristics [Table 7: Current sense \(8 V < VCC < 18 V\)](#)).
- **Diagnostic flag in fault conditions**, delivering a fixed voltage V_{SENSEH} up to a maximum current I_{SENSEH} in case of the following fault conditions (refer to [Table 11: Truth table](#)):
 - Power limitation activation
 - Overtemperature
 - Short to V_{CC} in off-state
 - Open-load in off-state with additional external components.

A logic level high on CS_DIS pin sets at the same time all the current sense pins of the device in a high-impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing of sense resistance and ADC line among different devices.

Figure 33. Current sense and diagnostic

3.3.1 Short to V_{CC} and off-state open-load detection

Short to V_{CC}

A short-circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the ON-state depending on the nature of the short-circuit.

Off-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable V_{PU} to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

An external pull-down resistor R_{PD} connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see [Figure 33: Current sense and diagnostic](#)).

R_{PD} must be selected in order to ensure $V_{OUT} < V_{OLmin}$ unless pulled-up by the external circuitry:

Equation 2:

$$V_{OUT}|_{Pull-up_OFF} = R_{PD} \cdot I_{L(off2)f} < V_{OLmin} = 2V$$

$R_{PD} \leq 22\text{ k}\Omega$ is recommended.

For proper open-load detection in off-state, the external pull-up resistor must be selected according to the following formula:

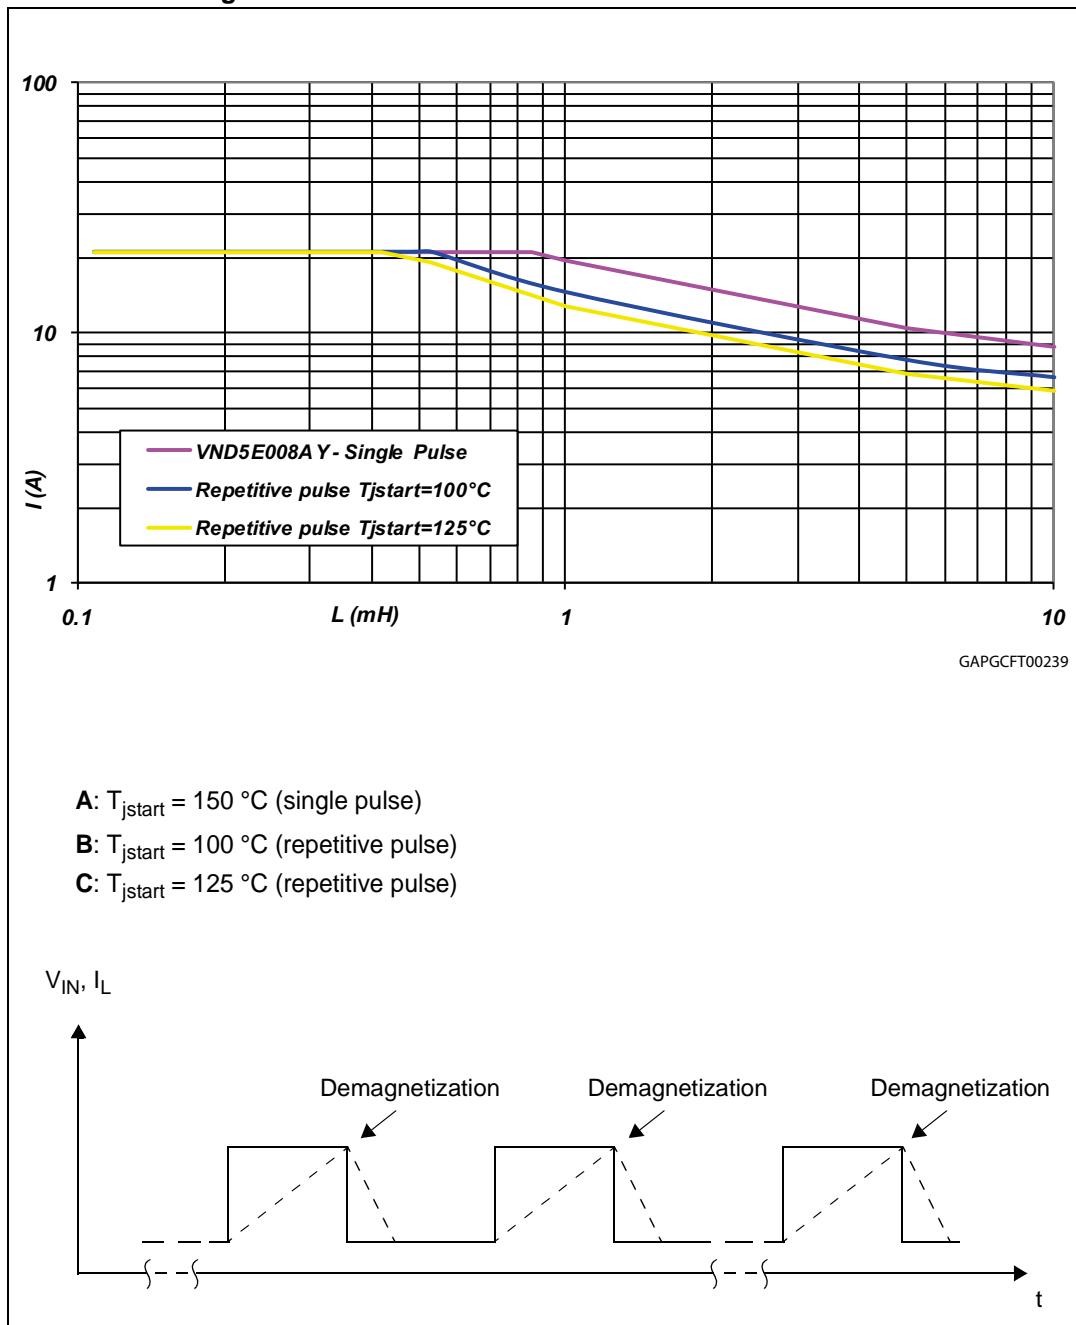

Equation 3:

$$V_{OUT}|_{Pull-up_ON} = \frac{(R_{PD} \cdot V_{PU}) - (R_{PU} \cdot R_{PD} \cdot I_{L(off2)r})}{(R_{PU} + R_{PD})} > V_{OLmax} = 4V$$

For the values of V_{OLmin} , V_{OLmax} , $I_{L(off2)r}$ and $I_{L(off2)f}$ (see [Table 8: Open-load detection \(8 V < VCC < 18 V\)](#)).

3.4 Maximum demagnetization energy ($V_{CC} = 13.5$ V)

Figure 34. Maximum turn-off current versus inductance

Note:

Values are generated with $R_L = 0 \Omega$.

In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

4 Package and PCB thermal data

5 Package information

5.1 ECOPACK® packages

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com.
ECOPACK® is an ST trademark.

5.2 PowerSSO-36 mechanical data
